The Metaphysics of Consciousness

What is consciousness? What is its place in the physical universe? How did it arise in the course of cosmic evolution? Can there be a genuine scientific understanding of consciousness? And is there such a thing as a genuine human self? These and related questions occupy a prominent place in contemporary studies in metaphysics and philosophy of mind, often involving complex interdisciplinary connections between philosophy, psychology, artificial intelligence, biology, and cognitive neuroscience. At the same time, these questions play a fundamental role in the philosophies of great thinkers of the past such as, among others, Plotinus, Descartes, Leibniz, Kant, William James, and Edmund Husserl. This collection of essays aims at sparking fruitful lines of future inquiry by bringing together systematically oriented historians of philosophy and contemporary leading philosophers of mind to re-examine a broad range of inherited views. In a pluralistic vein—and in the attempt to do full justice to the richness of our mental life—the volume features in-depth examinations not solely of mainstream physicalist doctrines, but also of largely neglected yet in many ways still attractive positions such as Cartesian dualism, idealism, and panpsychism.
