whom have remained in the country. JICA investigated whether Moldova's healthcare needs were burdened by accepting a large number of Ukrainian refugees, and examined the way to support them

Method: JICA dispatched the 3rd team as a survey team. The 2nd team consisted of two medical doctors, one nurse/midwife, one clinical engineer (CE), one Japan DMAT logistician, and two JICA staff. The dispatch period was three weeks when five major hospitals were visited in the capital, evaluating the current situation and the need for support for the future.

Results: As of April 6, 2022, 3,853 people were staying in refugee accommodation centers, while the rest lived in ordinary Moldovan families. Evacuees, like Moldovan citizens, were covered by health insurance, and evacuees had access to medical care. Medical institutions were not overwhelmed by medical needs due to the Ukraine crisis. There was no epidemic of infectious diseases even at evacuation centers. However, since there was no system to share emergency information between hospitals, we held a disaster medical seminar to introduce the current situation of disaster support in Japan and supporting EMTCC. **Conclusion:** As a survey team, not only doctors but also nurses, midwives, and CEs surveyed, making it easier to understand the specific medical needs at medical facilities. Most of the evacuees stayed in ordinary Moldovan homes, and it is possible that avoiding a crowded environment at the evacuation shelters prevented the epidemic of infectious diseases.

- 3. Bangladesh University of Health Sciences, Dhaka, Bangladesh
- 4. Médecins Sans Frontières, Barcelona, Spain
- 5. Médecins Sans Frontières, Amsterdam, Netherlands

Introduction: 919,000 Rohingya refugees live in overcrowded camps in Cox's Bazar, Bangladesh after fleeing violence in Myanmar. The Médecins Sans Frontières (MSF) Goyalmara Hospital offers the highest level of pediatric and neonatal care serving the Rohingya refugees and palliative care is gradually being integrated due to high mortality and medical complexity of patients. The purpose of this study was to understand the moral experiences of staff involved in providing palliative care to inform program implementation at Goyalmara Hospital and in other humanitarian contexts.

Method: This focused ethnography was conducted between March-August 2021 at Goyalmara Hospital. Data collection involved participant-observation, individual interviews (22), focus group discussions (5), and analysis of protocols and other documents. Interviews and focus groups were audio-recorded, translated, and transcribed. A coding scheme was developed, and data coded using NVivo 11.

Results: A key finding of this study was the important yet contested role of clinical guidelines and policies in palliative care related decision-making which was shaped by the authority and impermanent presence of international staff in the project. Staff saw clinical guidelines as a valuable resource that supported a consistent approach to care over time, and some locally hired staff used clinical guidelines as a tool to support their point of view during care planning discussions with international staff. Others felt that palliative care guidelines and other policies were inappropriately or rigidly applied, particularly surrounding decisions to refer (or not refer) patients to a higher level of care, or to discontinue certain medical treatments at end of life.

Conclusion: MSF staff experienced tension between the need for clarity and consistency, and the need to tailor guidelines to the context, patient, and family. Open discussion of staff concerns may alleviate moral distress and alert teams to areas where advocacy, staff psycho-social support, training, or clinical mentoring are needed.

Utilization of Regular Ships as Hospital Ships in a Disaster Situation: A Trial Report from Japan

Yosuke Takada RN, PHN, MSc, PhD^1 , Hiroshi Nakamura MD, PhD^2 , Mayumi Kako RN, PhD^3

- Japanese Red Cross Hiroshima College of Nursing, Hatsukaichi, Japan
- National Hospital Organization Kure Medical Center and Chugoku Cancer Center, Kure, Japan
- 3. Hiroshima University, Hiroshima, Japan

Introduction: Japan is an island nation surrounded by the ocean. Seventy percent of the country is mountainous, and there is no abundance of habitable flat land. Japan is a disaster-prone country, with an average of 25 typhoons per year occurring near Japan and 20% of the world's earthquakes of magnitude six or greater occurring in Japan. The Great East Japan Earthquake (2011) destroyed many medical facilities in coastal areas. The government is seeking ways to continue medical services using ships in preparation for future Nankai Trough Earthquakes. This study introduces the current status of studies for installing hospital ships in Japan.

Method: Based on materials on hospital ships published by the Cabinet Office and reports on training exercises conducted by various organizations, this report summarizes the current status of studies on introducing hospital ships in Japan.

Results: In 1991, a committee was established to gather domestic experts to study a multi-purpose ship, and various studies have been conducted intermittently. The current policy focuses on utilizing existing resources such as Self-Defense Force cargo ships, civilian car ferries, etc. The demonstration training for a hospital ship with the Self-Defense Force's field surgery system and the Red Cross Emergency Response Unit has been conducted. Other studies are underway to provide medical support to remote islands by ocean tugboats. Future issues for utilizing existing ships include 1) maintaining medical personnel and medical equipment and materials in times of disaster, 2)

utilizing and maintaining ships during peacetime, and 3) establishing access to ships that are unable to dock at a port.

Conclusion: Hospital ships in Japan are considered to utilize existing vessels rather than building new ones. However, there are unresolved issues, such as how to operate the ships during disasters, the cost of maintenance, and transporting patients from land.

Assessing Local Community Resilience Through Co-design Processes by an Australian Primary Health Network

Donna Pettigrew¹, Penelope Burns^{1,2}, Joanne Harding¹

- 1. Sydney North Health Network, Sydney, Australia
- 2. The Australian National University, Canberra, Australia

Introduction: The Sydney North Health Network (SNHN) covers an area of 350 square miles in Eastern Australia. It is one of 31 Primary Health Networks (PHNs) across Australia. The purpose of PHNs is to improve access to primary healthcare particularly those at risk of poor health outcomes. During disasters these vulnerable groups may be even more disadvantaged. As part of SNHN's role in enhancing the wellbeing, resilience, and preparedness of communities and primary healthcare providers during disasters, SNHN is focusing on recovery and resilience initiatives that build on local strengths, while addressing challenges.

Method: The aim of this community engagement research was to determine the impact of recent extreme weather events on the community, and identify strategies to improve wellbeing, resilience and preparedness. The research was approached through a co-design process to explore assets, strengths and vulnerabilities within vulnerable community members during disasters, and to ascertain their perspective on their needs during disasters. SNHN funded a well-established local community organization to conduct surveys and focus groups with the SNHN community to inform future community-led programs to support individuals and communities in disasters.

Results: Participants considered impacts on mental and physical health, children, the environment, and property as key challenges. Equally, they acknowledged they didn't start as a "blank slate", but came to the disaster with considerable individual and community strengths and assets, that enabled their resilience, including numerous resources to support social capital. Person-centered, community-inclusive planning, preparedness, and connectedness was seen as key solution.

Conclusion: In order to promote and enhance the wellbeing, resilience, and preparedness of communities and primary healthcare providers, successful recovery and resilience initiatives should build on local strengths, while addressing challenges. Individuals and communities should be integral in designing programs to build their local resilience and wellbeing, as they know their attributes and strengths, and their needs.

Assessing the Preparedness for a Cyanide Poisoning Mass Casualty Incident in Brooklyn

Jay Pandya MD^1 , Donald Doukas MD^1 , Pia Daniel MD^2 , Mark Silverberg $MD^{1,2}$

- New York City Health and Hospitals Kings County, Brooklyn, USA
- 2. SUNY Downstate Medical Center, Brooklyn, USA

Introduction: Urban communities are under constant threat of numerous potential disasters, including cyanide exposure events. Exposure can occur in settings such as structure fires, industrial accidents, or even intentional acts of terrorism. The typical treatment modality for cyanide toxicity employs the antidote, hydroxocobalamin. While studies regarding antidote availability have been conducted in Korea and Hong Kong, a literature search did not reveal any such studies in any part of New York City.

The borough of Brooklyn has a population of 2.57 million people. In the setting of a mass casualty incident (MCI) involving cyanide toxicity, such as a large structural fire or a chemical attack, it is uncertain of the region's capability to provide hydroxocobalamin. The objective of this study is to assess the stockpile of hydroxocobalamin across acute care hospitals in Brooklyn.

The amount of hydroxocobalamin required to treat a cyanide-related MCI was based on recommendations from the 2018 US Expert Consensus Guidelines for Stockpiling Antidotes. Ten grams of hydroxocobalamin are needed for each 100-kg patient. Theoretically, a minimum of 50 grams of hydroxocobalamin would be required for a mass casualty incident (5 patients).

Method: Fifteen acute care hospitals within Brooklyn were identified as potential treatment sites for cyanide exposure. Each site's emergency manager was sent a survey identifying hydroxocobalamin availability in both their pharmacy and their emergency department.

Results: All 15 hospitals responded to the survey. Two of the 15 hospitals had at least 50g of hydroxocobalamin in their inventory, however, no hospital had 50g stored in their emergency department. The median amount of hydroxocobalamin stored was 20g or two doses.

Conclusion: Should a mass casualty incident involving cyanide exposure occur, only two hospitals in the borough of Brooklyn would be prepared to treat five or more patients presenting to their hospital.
