# HIPPARCOS EXTRAGALACTIC LINK 

Preliminary Bonn, Potsdam and Kiev solutions

P. BROSCHE ${ }^{1}$, M. GEFFERT ${ }^{1}$, S. HIRTE ${ }^{2}$, N. KHARCHENKO ${ }^{3}$,<br>V. KISLYUK ${ }^{3}$, M. ODENKIRCHEN ${ }^{1}$, S. RYBKA ${ }^{3}$, E. SCHILBACH ${ }^{2}$, R.-D. SCHOLZ ${ }^{2}$, H.-J. TUCHOLKE ${ }^{1}$ AND A. YATSENKO ${ }^{3}$<br>${ }^{1}$ Sternwarte der Universität Bonn, Germany<br>${ }^{2}$ WIP Astronomie, Universität Potsdam, Germany<br>${ }^{3}$ Main Astronomical Observatory, Kiev, Ukraine

Hipparcos proper motions contain an unknown angular velocity $\omega$ relative to a non-rotating system. The basic equations for its derivation are:

$$
\begin{align*}
\Delta \mu_{\alpha} \cos \delta & =-\omega_{1} \cos \alpha \sin \delta \\
\Delta \mu_{\delta} & =+\omega_{1} \sin \alpha \sin \delta \tag{1}
\end{align*} \quad-\omega_{2} \cos \alpha, \omega_{3} \cos \delta
$$

where $\Delta \mu_{\alpha}$ and $\Delta \mu_{\delta}$ are absolute minus Hipparcos proper motions.

|  | Bonn | Potsdam | Kiev |
| :--- | :---: | :---: | :---: |
| photographic plates | astrograph | Schmidt | astrograph |
| $m$ link fields | 8 | 10 | 183 |
| $n$ link stars | 33 | 104 | 1015 |
| galaxies per field | 1 to 5 | 300 to 2000 | 3 to 5 |
| base line [years] | 70 to 90 | 20 to 40 | 20 to 40 |
| random p.m. error per star [mas/yr] | 0.5 to 1.5 | 3 to 5 | 5 to 12 |
| syst. abs. p.m. error per field [mas/yr] | 1.0 to 1.5 | $\sim 2$ | $\sim 4$ |
| $r m s$ of solution of $(1)$ [mas/yr] | 5 | 8 | 14 |
| $\omega_{1} \pm \sigma\left(\omega_{1}\right)$ [mas/yr] | $+1.2 \pm 1.0$ | $+0.8 \pm 1.0$ | $-1.5 \pm 0.7$ |
| $\omega_{2} \pm \sigma\left(\omega_{2}\right)$ [mas/yr] | $+3.2 \pm 0.7$ | $-0.7 \pm 1.0$ | $-2.0 \pm 0.5$ |
| $\omega_{3} \pm \sigma\left(\omega_{3}\right)$ [mas/yr] | $+0.0 \pm 1.1$ | $+0.5 \pm 1.0$ | $+1.2 \pm 0.5$ |

The Table describes three different absolute proper motion programmes and shows preliminary link results with H 30 data. The number of Bonn and Potsdam link fields will be increased (to 15 and 50 , respectively) so that the influence of possible systematic effects - not represented by the formal errors $\sigma\left(\omega_{i}\right)$ - can be further reduced. We expect to provide an accuracy of the final link of the Hipparcos proper motions of better than $1 \mathrm{mas} / \mathrm{yr}$, competitive with other link programmes (Lick/Yale, VLBI, HST).
