Helicopter Theory

Wayne Johnson

In a depth and range not previously available, Wayne Johnson provides a modern, comprehensive, and consistent coverage of the fundamentals of helicopter theory. In doing so, he focuses on the engineering analysis required to design, develop, and evaluate helicopters rather than on the synthesis or testing of the aircraft. For the design of a successful helicopter, both the first cost and operating cost of the rotor system must be weighed against the value of vertical flight capability, while the penalties of vertical flight must be minimized. 1,090 pages. £52.90

The Shorts 360 wide-body commuter airliner made its first flight on 1st June — some six months ahead of schedule. The 36 seat 360 has been specifically designed for short-haul operation. Powered by two Pratt & Whitney PT6-65R engines, the first prototype will fly initially with PT6A-45 engines, although these will be exchanged for the more powerful -65 engines as the flight development programme progresses. Low noise levels are an important feature of this new aircraft and the combination of the new PT6 turboprops and advanced design propellers ensure excellent hush properties.
