pressed for the former, and as the book weighs seven pounds it is obviously far too bulky for the latter. The information is grouped under genera, which may be satisfactory for monotypic or small genera (which get a disproportionate amount of space) but which make it necessary, in a large genus like *Accipiter* and *Falco*, to wade through many pages to extract little bits of information on a particular species; also there is much to criticise in the drawings that adorn this section.

The outstanding feature of the book is the magnificent series of action photographs by Shelly Grossman. Admittedly most of these are of captive birds, and where photographs of wild birds occur they are often undistinguished unless by other photographers such as Eric Hosking. But only by the use of trained captive birds could one hope to obtain some of these action sequences, for instance those of the horned owl and a snake, and a red-tailed hawk and opossum, and they have been intelligently selected to show features of the basic biology, for instance the use of the cutting tool on the mandible in Falco.

Quite evidently this book represents an enormous amount of work, and it will contain enough material on raptors to satisfy many people and perhaps stimulate others. But it seems a pity that the authors did not concentrate on the photographic material with enlarged sections on habits especially as revealed by captive birds, without attempting to do the impossible and include information on all species. This certainly cannot be done without much greater compression and terseness than is found here.

## The Birds of Natal and Zululand, by P. A. Clancey. Oliver & Boyd, 84s.

This book is a noteworthy achievement. It will be indispensable to the student of ornithology, and welcomed by all interested in South African birds. It reflects the greatest credit on the energy of the author, also on the printers. Detailed plumage descriptions are followed by field notes, with reference to nests and breeding seasons, but no account of the eggs. Subspecies are treated on a specific basis and the impression is that attention has been less to field data than to taxonomic considerations. The bird illustrations are all the author's work and in the main are colourful and pleasing, but it is a pity that more species did not receive colour treatment instead of grouping individuals in one species.

Natal's extensive grasslands are divided into types according to altitude, and are distinctive in the avifaunal populations. The excellent photographs of the countryside include three of the "highveld sourveld" but regrettably none of the midland "nkonkoni" grassveld. The country descends rapidly from 10,000 feet to sea-level and its zoogeography is of great interest; so it is unfortunate that the map, instead of being topographical is reproduced from a tourist road guide. There are some distributional omissions, for the author has not yet investigated certain areas, as shown by the addenda which result largely from a recent paper on a part of the Drakensberg foothills, and there will be some disagreement with certain subspecific divisions. Small imperfections, however, do not alter a very readable and most competent volume, which is a valuable contribution to the biological literature of an interesting region.

## About Sharks and Shark Attack, by David H. Davies. Routledge & Kegan Paul, 40s.

The picture of 'the triangular fin of a shark cutting through the water' is a stock element of many thrillers; in popular imagination the savagery of the shark is unequalled, but the true facts about sharks' attacks on man are less well known. In this book Dr. Davies describes in detail—
