Rehabilitation and Diagnostic Center Ministry of the Health of Ukraine, Konstantinovka, Ukraine

Research objective: Diagnostics of level of uneasiness at children with damage intrafamily relations and working out of the recommendation about the most effective methods of psychocorrectional work.

Objective: 64 persons took part In research. From them 38 maidens. (59,3%), 26 it is small. (40,6%). The age of the surveyed has made from 6 till 10 years.

Methods:

- 1) a technique of measurement of level of uneasiness of Taylor (adaptation by Norakidze),
- 2) projective techniques: «family Drawing», and «the Nonexistent animal».

Results: At 46 people (71,8%) high level of uneasiness is revealed; at 18 foreheads (28,1%) the uneasiness average level-was revealed; uncertainty in and a low self-estimation ($p \leq 0,05$).

More often the surveyed mark such features in intrafamily mutual relations as: verbal aggression from members of a family to the examinee, critical noticed and neglect interests of the child, and as absence of joint activity with parents.

Conclusions: Presence of uneasiness, a low self-estimation and sensation of emotional isolation, specify on family desadaptation and use of inadequate approaches in education. In system of complex psychocorrectional work with children of the given contingent, it is expedient to apply a method of group psychotherapy with relaxation elements (respiratory and muscular), dreams therapy.
