To find k, let the arc diminish and tend to zero, then the ratio chord : arc $\rightarrow$ 1, and $OG_1 \rightarrow$ the radius, hence finally

$$OG = \text{radius} \times \frac{\text{chord}}{\text{arc}}.$$

Nomogram for the Solution of the Equation $z^3 + pz + q = 0$.

The curve $y = x^3$ is constructed with a scale of 1″ horizontally and $\frac{1}{10}$″ vertically. It is graduated with the values of x. Then draw the two lines $x = \pm 1$ and graduate them on the scale of the y-axis, $x = +1$ positive downwards, $x = -1$ positive upwards.

To solve the equation $z^3 + pz + q = 0$, set $p + q$ on the line $x = +1$ and $p - q$ on the line $x = -1$. Join the two points and get the intersections with the curve. The accompanying diagram has only a range between $\pm 3{\cdot}5$, but it is easy to divide the roots by 2, 3, or 10. If accurately drawn, it should give two figures of the root with ease, as a rule, and may give three. Sometimes, of course, it may be difficult to separate the roots, *e.g.* in the equation $z^3 - 13z + 18 = 0$. The line seems to touch about $+2{\cdot}2$, and the 3rd root is off the paper. Dividing the roots by 2, we get $z^3 - 3{\cdot}25z + 2{\cdot}25 = 0$. We see that 1 is a root, another root is $-2{\cdot}08$, and therefore the third root is $+1{\cdot}08$. Hence the roots of the given equation are 2, $2{\cdot}16$, $-4{\cdot}16$.

I find it convenient to use, instead of a ruler, which hides part of the diagram, a strip of celluloid with a fine line ruled on the lower surface.
