

Another disconcerting factor is the author's unwillingness to judge the literature. He refers to many papers with the format "disease A has been reported to cause abnormalities in evoked potential Z" without providing the reader with any idea whether he considers the findings valid or important. This is unfortunate, since for any student an ounce of opinion is often worth a pound of information.

This book is worth buying as a reference book for the laboratory. I would not recommend it as a textbook for the neurology resident who seeks to learn about evoked potentials.
