

a considerable series of flints and chalk fragments recently dredged from about 500 fathoms off the Kerry coast by the Fishery Branch of the Department of Agriculture for Ireland. At two points, moreover, *Miliolina*-limestone has been found. This is at once distinguished from the specimens of Cretaceous Chalk by the naked eye, and it affords an unexpected extension of the material described by Mr. R. H. Worth from a dredging off the south of Cornwall. The Irish specimens will be dealt with in a forthcoming memoir of the Geological Survey of Ireland, in which Mr. T. Crook and myself have brought together what we know of the rocks forming the sea-bottom off the coast from Donegal to Kerry. The small part played in this area by ice-borne material agrees with the discoveries of Herr Bøggild off the coast of Greenland. We are now fortunate in having Mr. Worth's work for consultation and guidance, since it not only includes his previously published observations of 1899, but affords a valuable review of all rocks that have been recorded from the English Channel area.

## OBITUARY.

---

### ALBERT AUGUSTE DE LAPPARENT.

BORN DECEMBER 30, 1839.

DIED MAY 5, 1908.

It is with profound regret that we record the decease of M. de Lapparent, one of the most eminent geologists of France, who since 1875 has been Professor of Geology and Mining in the Catholic Institute at Paris. To geologists in this country he has been, perhaps, most widely known for his excellent "Traité de Géologie," of which the first edition was published in eight parts (1881-83), and the fifth edition in three volumes (1906). It is a work of great labour and research, and gives the best summary we have had of European geology, especially in the portions relating to stratigraphical palæontology.

Of other works, his "Cours de Minéralogie," published in 1884, reached its fourth edition during the present year; and mention should also be made of "Le Globe Terrestre," published in 1899. Interested largely in earth movements and earth sculpture, de Lapparent contributed original articles on these and other subjects to the Bulletin of the Geological Society of France, and he assisted in the preparation of the geological maps of La Manche and other areas.

A suave and fluent speaker, he was in much request at scientific gatherings, and his visits to this country at the time of the International Geological Congress in 1888 and during the recent centenary celebrations will be long remembered by those who had the privilege of listening to his eloquent speeches. He was elected a Foreign Member of the Geological Society of London in 1887.
