Which generation will beat Huntington's Disease...

Veronica Tennant

forever?

Right now we're so close.

We've identified a "marker" that will lead us to the defective gene that sits in the body like a time bomb waiting for middle age before it goes off.

We know that the progressive memory loss and involuntary muscle spasms of Huntington's are brought on by this defective gene causing the premature death of brain cells.

What we don't know is why this gene is present in 1 out of every 10,000 people in our population. Or why it is inherited by only 50% of the children of a Huntington parent. Or why it waits until middle age to strike, often after another generation has been born to live every day with the fear that

they too may have inherited the Huntington gene from their parent.

For those with Huntington's

Here's my cheque to help you beat Huntington's Disease forever.
