Boarfish (*Capros aper*) is an underutilised pelagic fish species found in abundance in Irish waters<sup>(1)</sup>. Boarfish is a potential source of unique uncharacterised proteins. Research previously undertaken has shown a favourable effect of fish derived protein hydrolysate consumption on glycaemic control in diabetic murine models<sup>(2)</sup>. This study aims to investigate the effect of daily boarfish protein hydrolysate (BFH) consumption on glycated haemoglobin and body mass index (BMI) in overweight human participants.

A randomised parallel placebo-controlled human intervention study was undertaken to investigate the effect of consuming BFH for 12 weeks. Participants (n = 40) that met the following inclusion criteria were recruited; aged between 18–65 years, non-smoker, not currently pregnant or lactating, BMI > 25.0 kg/m<sup>2</sup> and, free from chronic illness. Participants were randomly assigned to consume either 3.5 g/day of BFH or 3.5 g of cellulose. Measures taken at baseline and post-intervention (week 12) include: height and weight, fasting glycated haemoglobin, glucose, insulin, leptin, glucagon like peptide (GLP-1), adiponectin and lipid profile. Analysis of covariance (ANCOVA) controlling for baseline values as well as other covariates (age & BMI), was used to compare differences between groups over time.

Compliance was reported as 95%. The BFH had no significant effect on any of the markers when compared with control. Although an equivalent dose of BFH demonstrated anti-diabetic properties in murine models, the same effects were not observed in humans and a larger dose may be required.

**Table 1.** Pre and post intervention characteristics, for both the Boarfish protein hydrolysate treatment (n = 20) and control group (n = 19)

	Control				Treatment				Significance (P value)
	TP1 Mean	±SD	TP2 Mean	±SD	TP1 Mean	±SD	TP2 Mean	±SD	
Age (y)	35.85 (10.83)				34.84 (11.64)				
Male/Female (n)	10:9				10:10				
BMI (Kg/m <sup>2</sup> )	30.65	3.87	30.69	3.98	31.58	5.22	31.73	4.92	0.488
HbA1c (mmol/L)	33.85	3.83	34.7	4.36	33.47	3.39	33.05	3.46	0.123
HbA1c (%)	5.23	0.36	5.32	0.40	5.21	0.32	5.18	0.31	0.133
Insulin (mg/mL)	94.72	47.1	83.58	41.51	90.61	41.15	76.27	42.57	0.523
Glucose (mmol/L)	5.28	0.67	5.08	0.48	5.12	0.44	4.84	0.51	0.188
HDL (mmol/L)	1.22	0.29	1.12	0.26	1.08	0.26	1.05	0.24	0.994
Total cholesterol (mmol/L)	4.19	0.78	4.16	0.65	4.08	0.79	4.14	0.54	0.979

BMI; body mass index, HDL; high density lipoprotein, LDL; low density lipoprotein, SD; standard deviation, TP; timepoint. P values are generated using ANCOVA assessing the mean difference between TP2 variables of the control group, and TP2 variables of the treatment group, with TP1 variables as the covariate.
