

types of patients. The job description should clearly delimit which of the above categories are required for the post.

The description should therefore specify the area served, the number of sessions required for dependence work, the nature and number of the remaining sessions, and the types of patient and substance problem that would be involved in the dependence work.

It is also helpful to indicate subspeciality duties additional to treatment. Because of the widespread inadequacy of the current services for alcohol, and more particularly for drug misusers, it is probable that an initial appointment of this nature will require the consultant to develop NHS services for the subspeciality, and to establish liaison with other treatment agencies. The latter include psychiatrists, general practitioners, physicians (especially in departments of gastroenterology), accident and emergency departments, social services, and voluntary organisations. Some of the consultant's time will be spent in the stimulation and guidance of facilities outside the NHS provided by statutory and voluntary services.

- (c) Because of the number of persons involved or interested in alcohol and drug dependence, the consultant and supporting staff will require identified sessions to undertake a training role; the trainees include psychiatrists, general practitioners, other hospital doctors, medical students (if near a university), and the paramedical professions; social workers, probation officers, psychologists and voluntary councillors. An educative role for the general public and for the media is also important. It may also be helpful to allocate sessions for research and planning.
- (d) Academic links with university departments should exist and be identified. The links need not be confined to departments of psychiatry. University departments should be asked to furnish for the job description an account of the academic ties.
- (e) Other links should also be described, e.g. with social services, health promotion services and voluntary agencies.
- (f) Membership on committees and planning groups should be identified.
- (g) On call duties require specification.

7. Facilities:

- (a) The nature (in-patient, out-patient, day-patient) of the facilities should be described.

- (b) Their sites should also be outlined.

- (c) The number of junior doctors and paramedical staff will be precisely stated. Because of the role the consultant will undertake in training psychiatrists, there is a need for rotation of psychiatric trainees to the consultant. Junior staff may also usefully include trainee general practitioners.

Because of the many social problems of patients, social work input should have been agreed. Treatment conducted or supervised by psychologists is undertaken in many areas, is undergoing rapid development, but is time consuming; for its purpose the service will require specified sessions of a psychologist. At least one community psychiatric nurse is necessary. The number of other nurses depends on the present and anticipated build up of out-patient, day-patient and in-patient services. Access to occupational therapy is required for both day-patients and in-patients. The provision of a proper level of nursing and other staff should not wait the development of services but is necessary for the growth of facilities.

A full-time secretary is crucial for the medical staff. The social work and psychology services require additional secretarial assistance.

- (d) Office and other facilities that are available require specification, keeping in mind the number of disciplines involved in alcohol and drug dependence. Space for teaching is required. Accommodation should be available for meetings by self-help organisations such as Alcoholics Anonymous.

8. Within a health district the responsibility for relevant patients should be delimited between general psychiatrists and the speciality consultant. In the case of an appointment to a regional or subregional unit, the psychiatrists within the districts covered by the unit would continue to undertake the clinical care of many patients with alcohol or drug problems, in view of the number of persons so affected.

9. In the case of a consultant post in drug dependence an employing authority may encounter an applicant who is suitable in all respects except that more experience and training are required in the field of drug dependence. In this event the employing authority will wish to know that funds are available for a proleptic appointment in drug dependence, through a request to the Community Services Division of the DHSS.

SUBSTANCE MISUSE SECTION

Child and Adolescent Psychiatry

The College's Child and Adolescent Psychiatry Specialist Section is now inviting submissions for a session of ten-minute presentations by senior registrars in child and adolescent psychiatry to be held as part of the Oxford Residential Conference from 24 to 26 September 1987.

Those interested in submitting papers should contact Dr Ian Berg, Department of Psychological Medicine (Children), The Clarendon Wing, The General Infirmary at Leeds, Belmont Grove, Leeds LS2 9NS, as soon as possible.
