(Received 9 December 2003)

Abstract We present a wavelet characterization of anisotropic Besov spaces $B_{p,q}^{\alpha}(\mathbb{R}^n)$, valid for the whole range $0 < p, q < \infty$, and in terms of multi-resolution analyses with dilation adapted to the anisotropy of the space. Our proofs combine classical techniques based on Bernstein and Jackson-type inequalities, and nonlinear methods for the cases p < 1. Among the consequences of our results, we characterize $B_{p,q}^{\alpha}$ as a linear approximation space, and derive embeddings and interpolation formulae for $B_{p,q}^{\alpha}$, which appear to be new in the literature when p < 1.

1. Introduction

The characterization of Besov norms as weighted sums of wavelet coefficients has important applications in data compression, nonlinear approximation and the numerical resolution of elliptic partial differential equations (see, for example, the survey papers [4, 6, 7]). In recent years, an increasing interest in non-isotropic models and semi-elliptic equations has turned attention to the more general class of anisotropic Besov spaces $B^{\alpha}_{p,q}(\mathbb{R}^n)$, where $\boldsymbol{\alpha} = (\alpha_1, \ldots, \alpha_n) \in \mathbb{R}^n_+$ and $0 < p, q < \infty$ [15, 16, 19]. Wavelet-based techniques for such problems depend on a corresponding characterization of $B^{\alpha}_{p,q}$ in terms of compactly supported wavelets, which has only recently been introduced by the authors in two different and independent frameworks^{*} [13, 14].

* Some earlier results with wavelets that are not compactly supported can be found in [1].

There were, however, some limitations in these works that we try to overcome here. The results in [14,16], for instance, provide characterizations of $B_{p,q}^{\alpha}$ with no restrictions in the indices α , p, q, but only for wavelet bases with a very special tensor-product construction and for function spaces defined in the unit cube $[0,1]^2$. On the other hand, the results in [13] were carried out with a very general multi-resolution analysis (MRA) setting in \mathbb{R}^d which allows the use of non-separable wavelets, but with very specific techniques of linear operators that only produced characterizations of $B_{p,q}^{\alpha}(\mathbb{R}^n)$ for indices $p, q \ge 1$. These two works, therefore, left open the study of the cases 0 with a general MRA setting of non-separable wavelets, which we think may play a useful role in certain applications.

The goal of the present paper is precisely to fill this gap by presenting a uniform approach to $B_{p,q}^{\alpha}(\mathbb{R}^n)$ that is valid in the whole range $0 < p, q < \infty$ and which takes into account the general MRA setting introduced in [13]. This requires a new strategy compared with [13], where classical methods based on Bernstein and Jackson inequalities must be combined with the nonlinear techniques introduced by DeVore and Popov in the isotropic situation (see [9] and also [3]). In fact, in this paper we shall focus more on the quasi-Banach setting, $0 , where nonlinear methods appear naturally, and we refer to [13] for a complete treatment of the linear methods in the Banach situation <math>p \ge 1$.

To be more precise, let us fix throughout the paper an anisotropy $\boldsymbol{a} = (a_1, \ldots, a_n)$, with all $a_1, \ldots, a_n > 0$ and normalized by $(1/a_1 + \cdots + 1/a_n)/n = 1$. The wavelet system we are looking for will be dilated by a matrix M, which we shall choose to be 'compatible' with \boldsymbol{a} . Namely, we let

$$M = \operatorname{diag}(\lambda^{1/a_1}, \dots, \lambda^{1/a_n}), \quad \text{for some } \lambda > 1, \tag{1.1}$$

so that we have 'the correct homogeneity' over Besov seminorms:

$$|\det M|^{1/p} |f(M \cdot)|_{B_{p,q}^{\alpha a}} = \lambda^{\alpha} |f|_{B_{p,q}^{\alpha a}}.$$

Our wavelet approach is based on multi-resolution analysis. We consider a fixed *scaling* function $\varphi \in L^2(\mathbb{R}^n)$ (which we assume to be compactly supported) and define, for each 0 , the multi-resolution spaces

$$V_j^{(p)} = \overline{\operatorname{span}}_{L^p} \{ \varphi_{j,\gamma}^{(p)} \equiv |\det M|^{j/p} \varphi(M^j \cdot -\gamma) \}_{\gamma \in \mathbb{Z}^n}, \quad j \in \mathbb{Z}.$$
 (1.2)

As is well known, these spaces are nested $V_j^{(p)} \subset V_{j+1}^{(p)} \subset \cdots$, so that one obtains a *multilevel decomposition* for every $f \in L^p(\mathbb{R}^n)$:

$$f = P_0^{(p)} f + \sum_{j=0}^{\infty} Q_j^{(p)} f, \quad f \in L^p(\mathbb{R}^n),$$
(1.3)

where $P_j^{(p)}$ are suitable 'projections' of L^p onto $V_j^{(p)}$ (which we shall define below) and $Q_j^{(p)}$ are 'details' given by $Q_j^{(p)} := P_{j+1}^{(p)} - P_j^{(p)}$. The first result in this paper can then be stated as follows.

Theorem 1.1. Let $0 < p, q < \infty$ and $\alpha > 0$. Then, for an MRA as above with a compactly supported and sufficiently smooth scaling function we have

$$B_{p,q}^{\alpha \boldsymbol{a}}(\mathbb{R}^n) = \bigg\{ f \in L^p(\mathbb{R}^n) : \sum_{j=0}^{\infty} \lambda^{\alpha j q} \|Q_j^{(p)}f\|_p^q < \infty \bigg\}.$$

Moreover, the following equivalence of (quasi)-seminorms holds:

$$\|f\|_{B^{\alpha a}_{p,q}} \sim \|P^{(p)}_0 f\|_p + \left[\sum_{j=0}^{\infty} \lambda^{\alpha j q} \|Q^{(p)}_j f\|_p^q\right]^{1/q} \quad \text{and} \quad |f|_{B^{\alpha a}_{p,q}} \sim \left[\sum_{j=-\infty}^{\infty} \lambda^{\alpha j q} \|Q^{(p)}_j f\|_p^q\right]^{1/q}.$$

The previous result can also be translated into the language of approximation theory. In fact, if we denote the *error of approximation of* $f \in L^p(\mathbb{R}^n)$ to $V_i^{(p)}$ by

$$E_{j}^{(p)}(f) := \inf_{g \in V_{j}^{(p)}} \|f - g\|_{p}, \quad j \in \mathbb{Z},$$

and define the approximation space of order (α, q) by

$$A_{q}^{\alpha}(L^{p}) = \left\{ f \in L^{p} : \|f\|_{p} + \left[\sum_{j=0}^{\infty} \lambda^{\alpha j q} \|E_{j}^{(p)}f\|_{p}^{q}\right]^{1/q} < \infty \right\},$$

then a reformulation of Theorem 1.1 will show that $A_q^{\alpha}(L^p) = B_{p,q}^{\alpha}(\mathbb{R}^n)$ with equivalent norms (see Theorem 5.1 below). We must say that it is precisely this application which will motivate our definition of the projector $P_j^{(p)}f$ for p < 1, as an *almost best approximation* of f to $V_j^{(p)}$. Dealing with such projectors will require some extra care, since typically they are nonlinear and of course they will not be continuous.

Before going into our second result, it is worth rephrasing our previous theorem when $p \ge 1$. In this case, if M is integer valued and $m = |\det M|$, then it is well known that there exists a *family of compactly supported wavelets* $\{\psi_1, \ldots, \psi_{m-1}\}$ such that $Q_j^{(p)}$ is a *linear projection* from L^p onto the subspace

$$W_j^{(p)} = \overline{\operatorname{span}}_{L^p} \{ \psi_{\ell;j,\gamma}^{(p)} \equiv |\det M|^{j/p} \psi_\ell(M^j \cdot -\gamma) : \gamma \in \mathbb{Z}^n, \ \ell = 1, \dots, m-1 \}$$

for every $j \in \mathbb{Z}$. Moreover, the multilevel decomposition in (1.3) takes the form

$$f = \sum_{\gamma \in \mathbb{Z}^n} c_{\gamma} \varphi_{\gamma} + \sum_{\ell=1}^{m-1} \sum_{j=0}^{\infty} \sum_{\gamma \in \mathbb{Z}^n} d_{\ell;j,\gamma} \psi_{\ell;j,\gamma}^{(p)}, \quad f \in L^p(\mathbb{R}^n),$$
(1.4)

and since the generators of $V_{j}^{\left(p\right)}$ and $W_{j}^{\left(p\right)}$ are p-stable bases we have

$$||P_0^{(p)}f||_p^p \sim \sum_{\gamma \in \mathbb{Z}^n} |c_{\gamma}|^p \text{ and } ||Q_j^{(p)}f||_p^p \sim \sum_{\ell=1}^{m-1} \sum_{\gamma \in \mathbb{Z}^n} |d_{\ell;j,\gamma}|^p, \quad j \in \mathbb{Z}.$$

Finally, the coefficients can be expressed in terms of a dual basis $\{\tilde{\varphi}_{\gamma}, \tilde{\psi}_{\ell;j,\gamma}\}_{\gamma,\ell,j}$ by

$$c_{\gamma} = \langle f, \tilde{\varphi}_{\gamma} \rangle$$
 and $d_{\ell;j,\gamma} = \langle f, \tilde{\psi}_{\ell;j,\gamma}^{(p')} \rangle, \quad \gamma \in \mathbb{Z}^n, \ j \in \mathbb{Z}, \ \ell = 1, \dots, m-1.$

If we insert this in Theorem 1.1, we obtain, when $p \ge 1$, a third and much more useful characterization of Besov spaces in terms of the size of the wavelet coefficients (compared with the size of 'details' and approximation errors above). These are the results obtained in [13].

Now observe that there is no hope that such reasoning can be applied when p < 1, since the nonlinearity of $P_j^{(p)}$ makes the space $\operatorname{Im} Q_j^{(p)}$ typically much larger than $W_j^{(p)}$. Our second main theorem gives a substitute for this situation and shows that, in a certain range of indices, the Besov spaces $B_{\tau,\tau}^{\alpha a}(\mathbb{R}^n)$ with $\tau < 1$ can be embedded in L^p for some p > 1, and have corresponding characterizations in terms of weighted sums of wavelet coefficients.

Theorem 1.2. Let $0 < \tau < \infty$, $n((1/\tau) - 1)_+ < \alpha < n/\tau$ and p > 1 given by $1/\tau = \alpha/n + 1/p$. Then $B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n) \hookrightarrow L^p$, and for an MRA as above we have

$$B_{\tau,\tau}^{\alpha \boldsymbol{a}} = \bigg\{ f \in L^p(\mathbb{R}^n) : \sum_{\gamma \in \mathbb{Z}^n} |\langle f, \tilde{\varphi}_{\gamma} \rangle|^{\tau} + \sum_{\ell=1}^{m-1} \sum_{j=0}^{\infty} \sum_{\gamma \in \mathbb{Z}^n} |\langle f, \tilde{\psi}_{\ell;j,\gamma}^{(p')} \rangle|^{\tau} < \infty \bigg\}.$$

Moreover, the following equivalence of quasi-seminorms holds:

$$\|f\|_{B^{\alpha a}_{\tau,\tau}} \sim \left[\sum_{\gamma \in \mathbb{Z}^n} |\langle f, \tilde{\varphi}_{\gamma} \rangle|^{\tau}\right]^{1/\tau} + \left[\sum_{\ell=1}^{m-1} \sum_{j=0}^{\infty} \sum_{\gamma \in \mathbb{Z}^n} |\langle f, \tilde{\psi}^{(p')}_{\ell;j,\gamma} \rangle|^{\tau}\right]^{1/\tau},$$
$$|f|_{B^{\alpha a}_{\tau,\tau}} \sim \left[\sum_{\ell=1}^{m-1} \sum_{j \in \mathbb{Z}} \sum_{\gamma \in \mathbb{Z}^n} |\langle f, \tilde{\psi}^{(p')}_{\ell;j,\gamma} \rangle|^{\tau}\right]^{1/\tau}.$$

As far as we know, a complete proof of the previous result, even in the isotropic situation, has only recently appeared in [4, Theorem 30.7], while previous works just focused on the domain $[0,1]^n$ (see [9]), or on *homogeneous* Besov spaces [11]. We also refer to [4] for modern applications of such theorems to problems involving thresholding.

Finally, we mention that among the consequences of our theorems there are some interpolation and embedding results for anisotropic Besov spaces which seem to be new in the literature when p < 1. These are presented in § 5, complementing those obtained for the unit cube in [16] and the isotropic case in [9]. We also make special reference to the preprint [19], discovered after this paper was drafted, which contains related results in nonlinear approximation and interpolation of anisotropic Besov spaces.

2. Background on anisotropic Besov spaces

Fix $\boldsymbol{a} = (a_1, \ldots, a_n)$, with $a_j > 0$ and $1/a_1 + \cdots + 1/a_n = n$. We denote by

$$|h|_{\boldsymbol{a}} = \sum_{j=1}^{n} |h_j|^{a_j}, \quad h = (h_1, \dots, h_n) \in \mathbb{R}^n,$$

the anisotropic pseudo-distance related to **a**. Observe that $|Mh|_{a} = \lambda |h|_{a}$. We use the standard notation $\Delta_{h}^{k} f$ for the kth iteration of the difference operator: $\Delta_{h} f(x) =$

 $f(x+h) - f(x), k \ge 1, x, h \in \mathbb{R}^n$. Also, if $\{e_1, \ldots, e_n\}$ is the canonical basis of \mathbb{R}^n , we write

$$\Delta_h^{\boldsymbol{\ell}} f(x) = (\Delta_{h_1 \boldsymbol{e}_1}^{\ell_1} \circ \dots \circ \Delta_{h_n \boldsymbol{e}_n}^{\ell_n}) f(x), \quad x \in \mathbb{R}^n,$$

for the mixed difference of order $\boldsymbol{\ell} = (\ell_1, \dots, \ell_n) \in \mathbb{N}^n$ and step $h = (h_1, \dots, h_n) \in \mathbb{R}^n$.

Let $0 < \alpha, p, q < \infty$ and write $\boldsymbol{\alpha} = \alpha \boldsymbol{a} = (\alpha_1, \dots, \alpha_n)$. Consider the smallest positive integer $L > \max\{\alpha_1, \dots, \alpha_n\}$. We say that a function $f \in L^p(\mathbb{R}^n)$ belongs to the *anisotropic Besov space* $B_{p,q}^{\boldsymbol{\alpha}}(\mathbb{R}^n)$ whenever

$$|f|_{B^{\boldsymbol{\alpha}}_{p,q}} := \sum_{|\boldsymbol{\ell}|=L} \left[\int_{\mathbb{R}^n} (|h|_{\boldsymbol{a}}^{-\boldsymbol{\alpha}} \|\Delta_h^{\boldsymbol{\ell}} f\|_p)^q \frac{\mathrm{d}h}{|h|_{\boldsymbol{a}}^n} \right]^{1/q} < \infty.$$
(2.1)

We denote the corresponding Besov quasinorm by $||f||_{B^{\alpha}_{p,q}} = ||f||_p + |f|_{B^{\alpha}_{p,q}}$.

We observe that our definition of seminorm in (2.1) is equivalent to other expressions which are common in the literature, with $\Delta_h^{\ell} f$ replaced by the *total difference operator* $\Delta_h^L f$ or by the *partial differences* $\Delta_{te_i}^{k_i} f$, for $k_i > \alpha_i$ (see, for example, [23, §2.3.4] or [22, §1.4], where proofs of the equivalences are given, valid also for p < 1). In this paper we shall stick to the mixed differences in (2.1), and some equivalent expressions using the *mixed modulus of continuity*

$$\omega_p^{\ell}(f;t) = \sup_{|h|_{\boldsymbol{a}} \leqslant t} \|\Delta_h^{\ell} f\|_p, \quad t > 0.$$

Proposition 2.1. The following quasi-seminorms are equivalent:

$$|f|_{B^{\boldsymbol{\alpha}}_{p,q}} \sim \sum_{|\boldsymbol{\ell}|=L} \left[\int_0^\infty (t^{-\alpha} \omega_p^{\boldsymbol{\ell}}(f;t))^q \frac{\mathrm{d}t}{t} \right]^{1/q} \sim \sum_{|\boldsymbol{\ell}|=L} \left[\sum_{j\in\mathbb{Z}} (\lambda^{j\alpha} \omega_p^{\boldsymbol{\ell}}(f;\lambda^{-j}))^q \right]^{1/q}.$$
 (2.2)

We sketch the proof of this proposition, since we could not find a precise reference in the anisotropic setting; the ideas, however, are more or less standard. We just need to show the first equivalence, since the last sum is just a discretization of the middle integral following from the monotonicity of the modulus of continuity. For the first assertion, the key is the equivalence between $\omega_p^{\ell}(f;t)$ and the *averaged modulus of continuity*, which we state separately below.

Proposition 2.2. Let $0 < p, q < \infty$ and $\ell = (\ell_1, \ldots, \ell_n)$ with $\ell_j \ge 1$. Then there exists $C = C(p, q, \ell, a) > 0$ and $c = c(\ell, a) \ge 1$ such that

$$\omega_p^{\ell}(f;t) \leqslant C \left(\frac{1}{t^n} \int_{|h|_{\boldsymbol{a}} \leqslant ct} \|\Delta_h^{\ell} f\|_p^q \,\mathrm{d}h \right)^{1/q}, \quad \forall t > 0.$$

$$(2.3)$$

Proof. To prove (2.3) we need an identity involving mixed difference operators with variable increments: for all $x, h, s \in \mathbb{R}^n$ and $m \ge 1$,

$$\Delta_{h}^{\boldsymbol{m}}f(x) = \sum_{\mathbf{1}\leqslant \boldsymbol{k}\leqslant \boldsymbol{m}} (-1)^{|\boldsymbol{k}|} \binom{\boldsymbol{m}}{\boldsymbol{k}} \bigg[\sum_{\mathbf{0}\leqslant \boldsymbol{\delta}\leqslant \mathbf{1}} (-1)^{|\boldsymbol{\delta}|} \Delta_{\boldsymbol{\delta}h+\boldsymbol{k}s}^{\boldsymbol{m}} f(x+(\mathbf{1}-\boldsymbol{\delta})\boldsymbol{k}h) \bigg].$$
(2.4)

Above we use common notation for multi-indices: $|\boldsymbol{m}| = m_1 + \cdots + m_n$,

$$\binom{\boldsymbol{m}}{\boldsymbol{k}} = \binom{m_1}{k_1} \cdots \binom{m_n}{k_n},$$

 $\boldsymbol{m}h = (m_1h_1, \ldots, m_nh_n)$ and $\boldsymbol{m} \ge 1$ if $m_j \ge 1$ for all $j = 1, \ldots, n$. The identity (2.4) is an anisotropic version of the one-dimensional formula

$$\Delta_h^m f(x) = \sum_{k=1}^m (-1)^k \binom{m}{k} [\Delta_{ks}^m f(x+kh) - \Delta_{h+ks}^m f(x)], \quad x, h, s \in \mathbb{R}$$

(see [8, p. 184]). We could not find any reference for (2.4), but once the formula is set, the reader can easily prove it by induction using the one-dimensional case. To pass from (2.4) to (2.3), one first takes L^p -norms on both sides of (2.4) and raises to the *q*th power using the quasi-triangular inequality. Next, integrate the resulting expressions over $|s|_{a} \leq t$ and enlarge the region of integration on the right appropriately, so that after taking the sup over *h* one concludes with (2.3).

Remark 2.3. As a final remark we should warn the reader that, when p < 1, our spaces do not coincide in general with the Besov spaces defined with Littlewood–Paley theory by Triebel *et al.* In particular, when $\alpha < n((1/p)-1)_+$ our spaces $B_{p,q}^{\alpha}(\mathbb{R}^n)$ contain functions which are not distributions, while Triebel's spaces may contain distributions which are not functions (see, for example, [21]). The interest in functional definitions (rather than distributional ones) seems to be motivated by various applications in approximation theory (see [9]).

3. Multi-resolution and nonlinear projectors

We recall briefly the multi-resolution setting introduced in [13]. Given the dilation matrix M in (1.1), we fix a pair of biorthogonal M-scaling functions $\{\varphi, \tilde{\varphi}\}$, which we assume to be bounded and compactly supported. These are crucial assumptions in applications, so we do not consider here more-general settings where the scaling functions have a different decay. We also recall from § 3.3 in [13] that the theory of multi-resolution analyses is naturally limited to matrices M with integer entries, a constraint which together with (1.1) implies that the anisotropies must be of the form $(1/a_1, \ldots, 1/a_n) \in \mathbb{R}_+ \log \mathbb{Z}_+^n$. From now on we shall only consider such anisotropies, although this constraint will not be used anywhere else in the paper (apart from the existence of $\{\varphi, \tilde{\varphi}\}$). We refer to §7.2 below for alternative ideas in other situations.

We will denote by $\{V_j^{(p)}\}_{j\in\mathbb{Z}}$ the multi-resolution spaces generated by φ as in (1.2). Observe that $f \in V_j^{(p)}$ if and only if $T^{-j}f \in V_0^{(p)}$, where $T = T_{(p)}$ denotes the isometry in $L^p(\mathbb{R}^n)$ given by $Tf(x) = |\det M|^{1/p}f(Mx)$.

We next show that the systems $\{\lambda^{jd/p}\varphi(M^j \cdot -\gamma)\}_{\gamma \in \mathbb{Z}^n}$ are *p*-stable bases of $V_j^{(p)}$. By a simple change of scale, it is enough to prove this for j = 0. We shall present a different argument from Cohen *et al.* (see [4, §3.7]), where only tensor-product scaling functions could be handled. These ideas will also be crucial later, when dealing with the nonlinear projectors $P_j^{(p)}$.

Proposition 3.1. Let φ , $\tilde{\varphi}$ be bounded and compactly supported biorthogonal scaling functions. Then $\{\varphi_{\gamma}\}_{\gamma \in \mathbb{Z}^n}$ is a *p*-stable basis of $V_0^{(p)}$, meaning that every $f \in V_0^{(p)}$ can be written uniquely as $f = \sum_{\gamma \in \mathbb{Z}^n} c_{\gamma} \varphi_{\gamma}$ for some $\{c_{\gamma}\} \in \ell^p(\mathbb{Z}^n)$, and moreover

$$\left\|\sum_{\gamma\in\mathbb{Z}^n}c_{\gamma}\varphi_{\gamma}\right\|_{L^p(\mathbb{R}^n)}\sim\left[\sum_{\gamma\in\mathbb{Z}^n}|c_{\gamma}|^p\right]^{1/p}$$

Proof. The proof for $1 \leq p < \infty$ is standard (see the appendix in [13]). We assume therefore that $0 . Then, for every sequence <math>\{c_k\}_{k \in \mathbb{Z}^n} \in \ell^p(\mathbb{Z}^n)$, we have

$$\int_{\mathbb{R}^n} \left| \sum_{k \in \mathbb{Z}^n} c_k \varphi(x-k) \right|^p \mathrm{d}x \leqslant \sum_{k \in \mathbb{Z}^n} |c_k|^p \|\varphi\|_{L^p}^p.$$

Thus, the series $\sum_{k \in \mathbb{Z}^n} c_k \varphi_k$ converges in L^p and defines a function in $V_0^{(p)}$. Conversely, let

$$f = \sum_{k \in \mathbb{Z}^n} c_k \varphi_k \in V_0^{(p)},$$

for a finitely non-zero sequence of scalars $\{c_k\}$. Then, the biorthogonality gives $c_k = \langle f, \tilde{\varphi}_k \rangle$, and therefore

$$|c_k| \leq \int_{\mathbb{R}^n} |f| \, |\tilde{\varphi}_k| \leq \|\tilde{\varphi}\|_{\infty} \int_{\tilde{J}_k} |f|,$$

where we denote by \tilde{J}_k the *compact set* $\tilde{J}_k = \text{Supp } \tilde{\varphi}_k = \tilde{J}_0 + k, \ k \in \mathbb{Z}^n$. Now, the key step is the equality of the finite-dimensional subspaces of $L^p(\tilde{J}_k)$:

$$V_0^{(p)}|_{\tilde{J}_k} := \{g\chi_{\tilde{J}_k} : g \in V_0^{(p)}\} = \operatorname{span}\{\varphi(\cdot - \ell)\chi_{\tilde{J}_k} : \ell \in \mathbb{Z}^n\}.$$
(3.1)

We conclude that $V_0^{(p)}|_{\tilde{J}_k}$ is *independent of* p, and by the equivalence of all quasinorms in finite-dimensional spaces we also have the reverse Hölder estimate

$$\int_{\tilde{J}_k} |g| \leqslant c \left(\int_{\tilde{J}_k} |g|^p \right)^{1/p}, \quad \forall g \in V_0^{(p)}, \tag{3.2}$$

with a constant c > 0 independent of g, and by translation invariance also independent of k. Thus,

$$\sum_{k \in \mathbb{Z}^n} |c_k|^p \leqslant \|\tilde{\varphi}\|_{\infty}^p \sum_{k \in \mathbb{Z}^n} \left(\int_{\tilde{J}_k} |f| \right)^p \leqslant c^p \sum_{k \in \mathbb{Z}^n} \int_{\tilde{J}_k} |f|^p \lesssim \int_{\mathbb{R}^n} |f|^p,$$

at least for $f \in \text{span}\{\varphi_k\}$. A density argument then establishes the proposition.

Let us now pass to the construction of the projectors onto $V_j^{(p)}$. When $p \ge 1$, one uses the standard definition in terms of φ and $\tilde{\varphi}$:

$$P_j = P_j^{(p)} : L^p(\mathbb{R}^n) \to V_j^{(p)}, \quad f \mapsto P_j f = \sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\varphi}_{j,k}^{(p')} \rangle \varphi_{j,k}^{(p)}$$

We recall that these are bounded linear projections satisfying

- (1) $||f P_j f||_p \lesssim E_j^{(p)}(f) = \inf_{g \in V_j^{(p)}} ||f g||_p;$ (2) $||f P_j f||_p \to 0$, as $j \to +\infty;$
- (3) $||P_j f||_p \to 0$, as $j \to -\infty$ (only when 1);

(4)
$$f = P_0 f + \sum_{j=0}^{\infty} Q_j f \left(= \sum_{j \in \mathbb{Z}} Q_j f, \text{ if } p > 1 \right), \forall f \in L^p(\mathbb{R}^n);$$

where in the last formula $Q_j = P_{j+1} - P_j$, and the convergence is in the L^p -norm.

For the cases $0 , the previous definition of <math>P_i$ is no longer valid since functions in $L^p(\mathbb{R}^n)$ may not be locally integrable. We proceed instead with a different definition based on nonlinear approximation (see the abstract framework in [3,9]). More precisely, consider first the space of 'piecewise $V_0^{(p)}$ -functions':

$$\mathcal{V}_{0}^{(p)} := \{ g \in L^{p}_{\text{loc}}(\mathbb{R}^{n}) \mid \forall \ell \in \mathbb{Z}^{n}, \; \exists f^{\ell} \in V_{0}^{(p)} : g|_{I_{\ell}} = f^{\ell}|_{I_{\ell}} \},$$

where I_{ℓ} denotes the cube $I_{\ell} = [0,1]^n + \ell$, $\ell \in \mathbb{Z}^n$. Note that $\mathcal{V}_0^{(p)}$ is a priori much larger than $V_0^{(p)}$. Next, we define a mapping assigning to every $f \in L^p_{\text{loc}}(\mathbb{R}^n)$ a function $R_0^{(p)} f \in \mathcal{V}_0^{(p)}$ so that

$$\|f - R_0^{(p)}f\|_{L^p(I_\ell)} = \inf_{g \in V_0^{(p)}} \|f - g\|_{L^p(I_\ell)}, \quad \forall \ell \in \mathbb{Z}^n.$$
(3.3)

That is, in each cube I_{ℓ} , $(R_0^{(p)}f)|_{I_{\ell}}$ is a best approximation to $f|_{I_{\ell}}$ in $V_0^{(p)}|_{I_{\ell}}$, which exists because the latter is a finite-dimensional (hence closed) subspace of $L^p(I_\ell)$ (see (3.1)). Since minimizers may be hard to compute, there is no loss if we take instead *near-best* approximations, that is if we define $R_0^{(p)} f \in \mathcal{V}_0^{(p)}$ so that

$$\|f - R_0^{(p)}f\|_{L^p(I_\ell)} \leq 2 \inf_{g \in V_0^{(p)}} \|f - g\|_{L^p(I_\ell)}, \quad \forall \ell \in \mathbb{Z}^n.$$
(3.4)

In either case we observe that $R_0^{(p)}$ is not necessarily continuous, nor even linear. From (3.4), however, it easily follows that $R_0^{(p)}f = f$ if $f \in \mathcal{V}_0^{(p)}$, and for all $f \in L^p(\mathbb{R}^n)$,

$$\|R_0^{(p)}f\|_{L^p(\mathbb{R}^n)}^p \leqslant \|f\|_{L^p(\mathbb{R}^n)}^p + \sum_{\ell \in \mathbb{Z}^n} \|f - R_0^{(p)}f\|_{L^p(I_\ell)}^p \leqslant 3\|f\|_{L^p(\mathbb{R}^n)}^p.$$
(3.5)

Finally, we define $P_0^{(p)}$ by composition of $R_0^{(p)}$ with $P_0^{(1)}$:

$$f \in L^p_{\text{loc}}(\mathbb{R}^n) \mapsto P_0^{(p)} f := P_0^{(1)}(R_0^{(p)} f) = \sum_{k \in \mathbb{Z}^n} \langle R_0^{(p)} f, \tilde{\varphi}_k \rangle \varphi_k.$$

Proposition 3.2. For every $0 , the (nonlinear) operator <math>P_0^{(p)}$ is a bounded projection from $L^p(\mathbb{R}^n)$ onto $V_0^{(p)}$, that is

$$P_0^{(p)}f = f, \quad \forall f \in V_0^{(p)}, \quad and \quad \|P_0^{(p)}f\|_p \leqslant C\|f\|_p, \quad f \in L^p(\mathbb{R}^n).$$
(3.6)

Moreover, there exists C > 0 such that

$$\|f - P_0^{(p)}f\|_p \leqslant C \inf_{g \in V_0^{(p)}} \|f - g\|_p, \quad \forall f \in L^p(\mathbb{R}^n).$$
(3.7)

Proof. For the first inequality, the same argument we gave in the proof of Proposition 3.1 shows that

$$\|P_0^{(1)}g\|_p \lesssim \left(\sum_{k \in \mathbb{Z}^n} |\langle g, \tilde{\varphi}_k \rangle|^p\right)^{1/p} \lesssim \|g\|_p, \quad \forall g \in \mathcal{V}_0^{(p)}, \tag{3.8}$$

and thus using (3.5) we easily obtain (3.6). The left-hand identity of (3.6) also follows from Proposition 3.1, since by p-stability every $f \in V_0^{(p)}$ can be written as $f = \sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\varphi}_k \rangle \varphi_k$ and we also have $R_0^{(p)} f = f$. For the last assertion, we take any $g \in \text{span}\{\varphi_k\}$, and use the previous results and the quasi-triangular inequality to obtain

Taking the infimum over all $g \in \text{span}\{\varphi_k\}$, which is dense in $V_0^{(p)}$, we obtain (3.7).

Remark 3.3. It is worth noting that for all $0 < \rho < p$, the (nonlinear) operator $P_0^{(\rho)}$ also defines a bounded projection from $L^p(\mathbb{R}^n)$ onto $V_0^{(p)}$. This is essentially due to the fact that $(R_0^{(\rho)}f)|_{I_\ell}$ is a near-best approximation to $f|_{I_\ell}$ in $V_0^{(p)}|_{I_\ell}$ (with a constant only depending on p, ρ and n), as it can be shown using reverse Hölder inequalities in $V_0^{(p)}|_{I_\ell} = V_0^{(\rho)}|_{I_\ell}$. Moreover, mimicking the same steps as in Proposition 3.2 one can also obtain (3.7) with $P_0^{(p)}$ replaced by $P_0^{(\rho)}$. We leave details to the reader.

Finally, one could repeat these same arguments to define projectors $P_j^{(p)}$ from $L^p(\mathbb{R}^n)$ onto $V_j^{(p)}$, via best approximations to $f|_{I_{j,\ell}}$ in $V_j^{(p)}|_{I_{j,\ell}}$, with $I_{j,\ell} = M^{-j}I_{\ell}$. This approach is equivalent to just letting

$$P_j^{(p)} := T^j P_0^{(p)} T^{-j}, \quad j \in \mathbb{Z},$$

which by homogeneity will satisfy analogous properties to $P_0^{(p)}$ in Proposition 3.2.

4. Bernstein and Jackson inequalities

The characterization of Besov spaces is typically obtained from direct and inverse inequalities involving moduli of smoothness. In this section we shall show that such inequalities hold for any of our 'admissible' MRAs, provided their corresponding scaling functions are smooth enough. We begin with the inverse inequality, which is also the simplest.

Proposition 4.1 (Bernstein-type inequality). If $\varphi \in B^{\boldsymbol{\alpha}}_{p,q}(\mathbb{R}^n)$, then

$$\|f\|_{B^{\alpha}_{p,q}} \lesssim \lambda^{\alpha j} \|f\|_{L^p}, \quad \forall f \in V^{(p)}_j.$$

$$(4.1)$$

Proof. Let us choose an integer $L > \max\{\alpha_1, \ldots, \alpha_n\}$. By scaling it suffices to show (4.1) for j = 0. We only include the proof for $0 (the other case is similar, see [13]). If <math>f = \sum_{k \in \mathbb{Z}^n} c_k \varphi_k \in V_0^{(p)}$, then for every $h \in \mathbb{R}^n$ the *p*-stability gives

$$\|\Delta_h^{\boldsymbol{\ell}} f\|_p^p \leqslant \sum_{k \in \mathbb{Z}^n} |c_k|^p \|\Delta_h^{\boldsymbol{\ell}} \varphi_k\|_p^p \lesssim \|f\|_p^p \|\Delta_h^{\boldsymbol{\ell}} \varphi\|_p^p.$$

Thus,

$$|f|_{B_{p,q}^{\alpha}} = \sum_{|\boldsymbol{\ell}|=L} \left[\int_{\mathbb{R}^n} (|h|_{\boldsymbol{a}}^{-\alpha} \|\Delta_h^{\boldsymbol{\ell}} f\|_p)^q \frac{\mathrm{d}h}{|h|_{\boldsymbol{a}}^n} \right]^{1/q} \lesssim \|f\|_p |\varphi|_{B_{p,q}^{\alpha}}$$

completing the proof of (4.1).

For the direct inequality we need an additional assumption on $\{\varphi, \tilde{\varphi}\}$ guaranteeing that there is an integer $L > \max\{\alpha_1, \ldots, \alpha_n\}$ so that the space $V_0^{(p)}$ contains locally the polynomials of total degree less than L:

$$\Pi_L = \operatorname{span}\{x_1^{r_1} \cdots x_n^{r_n} : r_1 + \cdots + r_n < L\}.$$

This means that for every compact set K and $P \in \Pi_L$ there exists $f \in V_0^{(p)}$ such that $f|_K = P|_K$. Such an assumption (which does not depend on $0) is known to follow from sufficient smoothness of the scaling function (e.g. <math>\varphi \in H^{La}(\mathbb{R}^n)$ (see [5, Theorem 2.1])). For the particular case L = 1, if $\varphi, \tilde{\varphi} \in L_c^{\infty}(\mathbb{R}^n)$, then it is easy to see that V_0 contains locally the constants (see, for example, [17, Theorem 6.3]).

Theorem 4.2 (Jackson-type inequality). If $V_0^{(p)}$ contains locally the polynomials of degree less than L, then

$$\|f - P_j^{(p)}f\|_p \lesssim \lambda^{-\alpha j} |f|_{B^{\boldsymbol{\alpha}}_{p,q}}, \quad \forall f \in B^{\boldsymbol{\alpha}}_{p,q}(\mathbb{R}^n).$$

$$(4.2)$$

Proof. Again, a scaling argument reduces matters to j = 0. We will just prove the case 0 (the other one being a bit simpler (see [13])). Following a more or less standard procedure, we first need to establish two lemmas.

Lemma 4.3 (local boundedness). In the conditions above, there exists a finite set $K_{\#} \subset \mathbb{Z}^n$ such that, for every $\gamma \in \mathbb{Z}^n$, we have

$$\|P_0^{(p)}f\|_{L^p(I_{\gamma})} \lesssim \|f\|_{L^p(\tilde{I}_{\gamma})}, \quad \forall f \in L^p_{\text{loc}}(\mathbb{R}^n),$$
(4.3)

where $\tilde{I}_{\gamma} = \bigcup_{m \in K_{\#}} (I_{\gamma} + m)$.

Lemma 4.4 (Whitney-type inequality). Let $f \in L^p_{loc}(\mathbb{R}^n)$ and $J = [a_1, b_1] \times \cdots \times [a_n, b_n]$ be a rectangle in \mathbb{R}^n . Then, for every $L \ge 1$ there exists a polynomial $Q \in \Pi_L$ such that

$$\|f - Q\|_{L^{p}(J)}^{p} \leqslant C \sum_{|\boldsymbol{\ell}| = L} \frac{1}{|J|} \int_{0}^{b_{1} - a_{1}} \cdots \int_{0}^{b_{n} - a_{n}} \|\Delta_{h}^{\boldsymbol{\ell}} f\|_{L^{p}(J)}^{p} \,\mathrm{d}h, \tag{4.4}$$

where C = C(n, p, L) > 0.

The first lemma has a similar proof to the isotropic case (see [3]). For completeness we include it below in the case p < 1.

Proof of Lemma 4.3. We may assume $\gamma = 0$ and let $I = [0, 1]^n$. By definition of the projector

$$\|P_0^{(p)}f\|_{L^p(I)}^p \leqslant \sum_m |\langle R_0^{(p)}f, \tilde{\varphi}_m \rangle|^p \int_I |\varphi_m|^p,$$

with the indices restricted to the finite set $K_{\sharp} = \{m \in \mathbb{Z}^n : I \cap [\text{Supp } \varphi + m] \neq \emptyset\}$. It therefore suffices to estimate one coefficient, which we may take to be m = 0. Now, proceeding as in Proposition 3.1,

$$|\langle R_0^{(p)} f, \tilde{\varphi} \rangle| \leqslant \|\tilde{\varphi}\|_{\infty} \int_{\tilde{J}_0} |R_0^{(p)} f| \leqslant c' \bigg[\int_{\tilde{J}_0} |R_0^{(p)} f|^p \bigg]^{1/p},$$

where we have used the fact that $R_0^{(p)} f$ is locally in $V_0^{(p)}$ and the equivalence of quasinorms in (3.2). The lemma now follows easily by a similar argument as in (3.5) above.

The second lemma is the crucial point in most Jackson-type inequalities. The proof for p < 1 is much more subtle than its counterpart for $p \ge 1$ (see, for example, [13, Lemma 4.3] for a simple proof in this last case). A classical reference is [24], but since our formulation is slightly different we indicate below how to derive it from there.

Proof of Lemma 4.4. We recall the statement of Theorem 1 in [24]: if $f \in L^p(J)$, then there exists a polynomial $Q \in \Pi_L$ such that

$$\|f - Q\|_{L^{p}(J)}^{p} \leqslant C \sum_{|\boldsymbol{\ell}| = L} \sup_{h_{j} < (b_{j} - a_{j})/(2L)} \|\Delta_{h}^{\boldsymbol{\ell}} f\|_{L^{p}(J_{h}^{\boldsymbol{\ell}})}^{p},$$
(4.5)

where J_h^{ℓ} denotes the rectangle $J \cap (J - \ell h)$ (that is, the domain of definition of $\Delta_h^{\ell} f$ when f is just defined in J). To pass from the right-hand side of (4.5) to (4.4) one uses one more time the identity of the difference operators in (2.4). Indeed, taking $L^p(J_h^{\ell})$ -norms in (2.4) and changing variables on the right-hand side we obtain the estimate

$$\|\Delta_h^{\boldsymbol{\ell}} f\|_{L^p(J_h^{\boldsymbol{\ell}})}^p \leqslant \sum_{\mathbf{0} \leqslant \boldsymbol{\delta} \leqslant \mathbf{1} \leqslant \boldsymbol{k} \leqslant \boldsymbol{\ell}} c_{\boldsymbol{k},\boldsymbol{\ell}} \|\Delta_{\boldsymbol{\delta} h + \boldsymbol{k} s}^{\boldsymbol{\ell}} f\|_{L^p(J)}^p.$$

One then integrates this inequality in $0 \leq s_j \leq (b_j - a_j)/2L$, takes the sup over $h_j < (b_j - a_j)/2L$, and after changing variables concludes easily with (4.4).

We turn now to the proof of (4.2), which by scaling we only need to prove for j = 0. Let us fix $\gamma \in \mathbb{Z}^n$ and a polynomial Q of degree less than L. Note that from our assumptions we have $Q \in \mathcal{V}_0^{(p)}$. Then, using Lemma 4.3 and (3.4) we obtain

$$\begin{split} \|f - P_0^{(p)} f\|_{L^p(I_{\gamma})} &\lesssim \|f - Q\|_{L^p(I_{\gamma})} + \|P_0^{(1)}(Q - R_0^{(p)}f)\|_{L^p(I_{\gamma})} \\ &\lesssim \|f - Q\|_{L^p(J_{\gamma})} + \|f - R_0^{(p)}f\|_{L^p(J_{\gamma})} \lesssim \|f - Q\|_{L^p(J_{\gamma})} \end{split}$$

Now, if for each $\gamma \in \mathbb{Z}^n$ we choose a polynomial $Q = Q^{\gamma}$ as in Lemma 4.4, we obtain

$$\|f - P_0^{(p)}f\|_{L^p(\mathbb{R}^n)}^p = \sum_{\gamma \in \mathbb{Z}^n} \|f - P_0^{(p)}f\|_{L^p(I_\gamma)}^p$$

$$\lesssim \sum_{\gamma \in \mathbb{Z}^n} \sum_{|\boldsymbol{\ell}| = L} \frac{1}{c^n} \int_{[0,c]^n} \|\Delta_h^{\boldsymbol{\ell}}f\|_{L^p(J_\gamma)}^p \,\mathrm{d}h$$

$$\lesssim \sum_{|\boldsymbol{\ell}| = L} \frac{1}{c^n} \int_{[0,c]^n} \|\Delta_h^{\boldsymbol{\ell}}f\|_{L^p(\mathbb{R}^n)}^p \,\mathrm{d}h$$

$$\lesssim \sum_{|\boldsymbol{\ell}| = L} \omega_p^{\boldsymbol{\ell}}(f,c')^p. \tag{4.6}$$

One now uses the equivalence between averaged moduli of continuity in Proposition 2.2 to conclude

$$\|f - P_0^{(p)}f\|_{L^p(\mathbb{R}^n)} \lesssim \sum_{|\boldsymbol{\ell}|=L} \left[\int_{|h|_{\boldsymbol{a}} \leqslant c^{\prime\prime}} \frac{|h|_{\boldsymbol{a}}^{n+\alpha q}}{|h|_{\boldsymbol{a}}^{n+\alpha q}} \|\Delta_h^{\boldsymbol{\ell}}f\|_{L^p(\mathbb{R}^n)}^q \,\mathrm{d}h \right]^{1/q} \lesssim |f|_{B^{\boldsymbol{\alpha}}_{p,q}(\mathbb{R}^n)},$$

recovering in the last step the definition of the seminorm in (2.1).

Remark 4.5. It is possible to weaken the assumptions of Theorem 4.2 using the following version of Lemma 4.4: for all $\ell = (\ell_1, \ldots, \ell_n) \ge 0$, there exists a polynomial $Q \in \Pi_{\ell}$ such that

$$\inf_{Q \in \Pi_{\ell}} \|f - Q\|_{L^{p}(J)}^{p} \lesssim \sum_{j=1}^{n} \frac{1}{b_{j} - a_{j}} \int_{0}^{b_{j} - a_{j}} \|\Delta_{t\boldsymbol{e}_{j}}^{\ell_{j}} f\|_{L^{p}(J)}^{p} \,\mathrm{d}t,$$

where $\Pi_{\ell} = \operatorname{span}\{x_j^{r_j} : 0 \leq r_j < \ell_j, j = 1, \ldots, n\}$. A self-contained proof for this result appears in [16, Theorem 3.1]. Using this, one can prove (4.2) by just assuming that V_0 contains locally Π_{ℓ} for some $\ell = (\ell_1, \ldots, \ell_n)$ with $\ell_j > \alpha_j$. At this point, however, we do not know of any simple translation of this condition in terms of the smoothness of φ (except in the simpler tensor-product case).

As a corollary of Theorem 4.2 with L = 1 we obtain a general property of the nonlinear projectors defined in § 3.

Corollary 4.6. If $\varphi, \tilde{\varphi} \in L^{\infty}_{c}(\mathbb{R}^{n})$, then the (nonlinear) projectors $P_{j}^{(p)}$ satisfy

$$\lim_{j \to \infty} \|f - P_j^{(p)}f\|_{L^p(\mathbb{R}^n)} = 0, \quad \forall f \in L^p(\mathbb{R}^n).$$

Proof. Let $\varepsilon > 0$ and $f_{\varepsilon} \in C_c^{\infty}(\mathbb{R}^n)$ be such that $||f - f_{\varepsilon}||_p < \varepsilon$. By the case L = 1 in Theorem 4.2 (which we can use since V_0 reproduces the constants when $\varphi, \tilde{\varphi} \in L_c^{\infty}(\mathbb{R}^n)$ [17, Theorem 6.3]), it follows that

$$\|f_{\varepsilon} - P_j^{(p)} f_{\varepsilon}\|_p \lesssim \lambda^{-j\alpha} \|f\|_{B^{\alpha}_{p,q}(\mathbb{R}^n)},$$

for some $\alpha > 0$. To conclude we need to use (3.7), since $P_i^{(p)}$ is not linear in general:

$$\begin{split} \|f - P_j^{(p)}f\|_p &\lesssim \inf_{g \in V_j^{(p)}} \|f - g\|_p \leqslant \|f - P_j^{(p)}f_{\varepsilon}\|_p \\ &\lesssim \|f - f_{\varepsilon}\|_p + \|f_{\varepsilon} - P_j^{(p)}f_{\varepsilon}\|_p \lesssim \varepsilon + \lambda^{-j\alpha} |f_{\varepsilon}|_{B^{\alpha}_{p,q}(\mathbb{R}^n)} \lesssim 2\varepsilon, \end{split}$$
arge enough.

if j is large enough.

5. The first theorem and its applications

We now have all the tools to prove the main results in this paper. Throughout this section we assume that the scaling function $\varphi \in B_{p,q}^{\alpha_0 a}(\mathbb{R}^n)$ for some $\alpha_0 > 0$, and that $V_0^{(p)}$ contains locally the polynomials of degree less than L for a fixed integer $L \ge 1$. Recall from $\S1$ that

$$E_j^{(p)}(f) := \inf_{g \in V_j^{(p)}} \|f - g\|_p.$$

Then we prove the following restatement of Theorem 1.1.

Theorem 5.1. Let $0 < p, q < \infty$. For every

$$0 < \alpha < \alpha^* := \min\left\{\alpha_0, \frac{L}{a_1}, \dots, \frac{L}{a_n}\right\}$$

we have

$$B_{p,q}^{\alpha \boldsymbol{a}}(\mathbb{R}^n) = \left\{ f \in L^p(\mathbb{R}^n) : \sum_{j=0}^{\infty} \lambda^{\alpha j q} \|Q_j^{(p)}f\|_p^q < \infty \right\}$$
$$= \left\{ f \in L^p(\mathbb{R}^n) : \sum_{j=0}^{\infty} \lambda^{\alpha j q} E_j^{(p)}(f)^q < \infty \right\}.$$

In this case, we have the equivalence of quasi-seminorms:

$$|f|_{B_{p,q}^{\alpha a}} \sim \left[\sum_{j \in \mathbb{Z}} (\lambda^{\alpha j} \| Q_j^{(p)} f \|_p)^q \right]^{1/q} \sim \left[\sum_{j \in \mathbb{Z}} (\lambda^{\alpha j} E_j^{(p)} (f))^q \right]^{1/q}.$$

Proof. Throughout the proof we denote by μ the number min $\{1, p\}$. We will only show the statement of the theorem involving $E_j^{(p)}(f)$. The statement involving $\|Q_j^{(p)}f\|_p$ follows easily from

$$\|Q_{j}^{(p)}f\|_{p} \leqslant E_{j}^{(p)}(f)^{\mu} + E_{j+1}^{(p)}(f)^{\mu} \leqslant 2\sum_{\ell \geqslant j} \|Q_{\ell}^{(p)}f\|_{p}^{\mu}, \quad j \in \mathbb{Z},$$

and inequalities of Hardy type (see, for example, [10, Theorem 2.1]). For the inclusion \subseteq' , the key step is the estimate

$$E_j^{(p)}(f) \lesssim \|f - P_j^{(p)}f\|_{L^p(\mathbb{R}^n)} \lesssim \sum_{|\boldsymbol{\ell}| = L} \omega_p^{\boldsymbol{\ell}}(f, c\lambda^{-j}), \quad j \in \mathbb{Z},$$

which we have seen in the proof of Jackson's inequality (see (4.6)). From here, and using the discrete definition of Besov seminorm in (2.2), we conclude easily that

$$\left[\sum_{j\in\mathbb{Z}} (\lambda^{\alpha j} E_j^{(p)}(f))^q\right]^{1/q} \lesssim |f|_{B_{p,q}^{\alpha a}},$$

For the converse ' \supseteq ', it suffices to show that for any $f \in L^p(\mathbb{R}^n)$ and $J \in \mathbb{N}$,

$$\omega_p^{\boldsymbol{\ell}}(f,\lambda^{-J}) \lesssim \lambda^{-J\alpha_0} \bigg[\sum_{j=-\infty}^{J} (\lambda^{\alpha_0 j} E_j^{(p)}(f))^{\mu} \bigg]^{1/\mu}, \quad |\boldsymbol{\ell}| = L.$$
(5.1)

Indeed, again an argument involving Hardy's inequality will give (for $0 < \alpha < \alpha_0$)

$$\left[\sum_{j\in\mathbb{Z}} (\lambda^{\alpha j} \omega_p^{\ell}(f, c\lambda^{-J}))^q\right]^{1/q} \lesssim \left[\sum_{j\in\mathbb{Z}} (\lambda^{\alpha j} E_j^{(p)}(f))^q\right]^{1/q},\tag{5.2}$$

from which we shall conclude the theorem.

To prove (5.1), we first write for any pair of integers J' < J,

$$\Delta_h^{\ell} f = \Delta_h^{\ell} (f - P_J^{(p)} f) + \Delta_h^{\ell} (P_{J'}^{(p)} f) + \sum_{j=J'}^{J-1} \Delta_h^{\ell} (Q_j^{(p)} f) + \sum_{j=J'}^{J-1} (Q_j^{(p)} (Q_j^{(p)} f) + \sum_{j=J'}^{J-1} (Q_j^{(p)} (Q_j^{(p)} (Q_j^{(p)} f) + \sum_{j=J'}^{J-1} (Q_j^{(p)} (Q_j^{(p)} (Q_j^{(p)} f)) + \sum_{j=J'}^{J-1} (Q_j^{(p)} ($$

Since by Bernstein's inequality $\lim_{J'\to-\infty} |P_{J'}^{(p)}f|_{B^{\alpha}_{p,q}} = 0$, we can take pointwise limits and use Fatou's Lemma to obtain

$$\|\Delta_{h}^{\ell}f\|_{p}^{\mu} \leq \|\Delta_{h}^{\ell}(f - P_{J}^{(p)}f)\|_{p}^{\mu} + \sum_{j=-\infty}^{J-1} \|\Delta_{h}^{\ell}(Q_{j}^{(p)}f)\|_{p}^{\mu}, \quad \text{a.e. } h \in \mathbb{R}^{n}.$$

Then, the same reasoning as in the proof of Bernstein's inequality gives

$$\begin{split} \|\Delta_{h}^{\ell}f\|_{p}^{\mu} &\lesssim \|f - P_{J}^{(p)}f\|_{p}^{\mu} + \sum_{j=-\infty}^{J-1} \|Q_{j}^{(p)}f\|_{p}^{\mu}\|\Delta_{h}^{\ell}\varphi_{j+1,0}\|_{p}^{\mu} \\ \text{by} \ (3.7) &\lesssim E_{J}^{(p)}(f)^{\mu} + \sum_{j=-\infty}^{J} E_{j}^{(p)}(f)^{\mu}\omega_{p}^{\ell}(\varphi,\lambda^{-(J-j)})^{\mu}, \quad \text{if} \ |h|_{a} \leqslant \lambda^{-J} \end{split}$$

Now using (2.3) one can control the modulus of continuity of φ by

$$\omega_p^{\boldsymbol{\ell}}(\varphi,\lambda^{-(J-j)}) \lesssim \lambda^{-(J-j)\alpha_0} |\varphi|_{B_{p,q}^{\alpha_0 a}}, \quad j \in \mathbb{Z}.$$

Substituting into the sum above and taking the sup over all $|h|_{a} \leq \lambda^{-J}$ we arrive at (5.1). This completes the proof of the theorem.

Our first corollary gives a rigorous justification of the multilevel decomposition in (1.3) for functions in $B_{p,q}^{\alpha a}(\mathbb{R}^n)$.

Corollary 5.2. In the conditions of the theorem, if $f \in B_{p,q}^{\alpha a}(\mathbb{R}^n)$, then we can write $f = P_0^{(p)}f + \sum_{j=0}^{\infty} Q_j^{(p)}f$ with convergence in the norm of $B_{p,q}^{\alpha a}$.

Proof. By Corollary 4.6, we only have to verify that

$$\lim_{j \to \infty} |f - P_j^{(p)} f|_{B_{p,q}^{\alpha a}} = 0, \quad f \in B_{p,q}^{\alpha a}(\mathbb{R}^n).$$

Now, using the elementary fact $E_{\ell}^{(p)}(f - P_j^{(p)}f) \leq E_{\max(j,\ell)}^{(p)}(f)$, it follows from the characterization in Theorem 5.1 that

$$\begin{split} |f - P_j^{(p)} f|_{B_{p,q}^{\alpha\alpha}}^q \lesssim \sum_{\ell \in \mathbb{Z}} (\lambda^{\ell\alpha} E_\ell^{(p)} (f - P_j^{(p)} f))^q \\ \lesssim \sum_{\ell \geqslant j} (\lambda^{\ell\alpha} E_\ell^{(p)} (f))^q \to 0, \quad \text{as } j \to \infty. \end{split}$$

Theorem 5.1 can also be written as $B_{p,q}^{\alpha a}(\mathbb{R}^n) = A_q^{\alpha}(L^p(\mathbb{R}^n))$, the latter denoting the space of L^p -approximation obtained from the approximating family $\{V_j^{(p)}\}_{j=0}^{\infty}$ (in the notation of [10]). This equality and the results in [9,10] give us the following interpolating properties of anisotropic Besov spaces.

Corollary 5.3. Let $0 < p, q < \infty$, $\alpha > 0$ and $\alpha = \alpha a$ as in §3. Then, for the real interpolation method we have the identity

$$(L^p(\mathbb{R}^n), B^{\boldsymbol{\alpha}}_{p,r}(\mathbb{R}^n))_{\theta,q} = B^{\theta \boldsymbol{\alpha}}_{p,q}(\mathbb{R}^n), \quad \forall 0 < \theta < 1 \text{ and } 0 < r < \infty$$

Moreover, if $0 < \alpha_0 < \alpha_1 < \infty$ and we let $\alpha_{\theta} = (1 - \theta)\alpha_0 + \theta\alpha_1$, then we also have

$$(B_{p,q_0}^{\alpha_0 \boldsymbol{a}}, B_{p,q_1}^{\alpha_1 \boldsymbol{a}})_{\theta,q} = B_{p,q}^{\alpha_\theta \boldsymbol{a}}, \quad \forall 0 < \theta < 1 \text{ and } 0 < q < \infty$$

Proof. This is a direct consequence of the identity $B_{p,q}^{\alpha a}(\mathbb{R}^n) = A_q^{\alpha}(L^p(\mathbb{R}^n))$, and Theorems 3.1 and 4.2 in [10] for the approximations spaces $A_q^{\alpha}(X)$.

We conclude with an embedding result announced in the introduction.

Corollary 5.4. Let $0 < p, q < \infty, \alpha > 0$ and

$$\frac{1}{\tau} = \frac{\alpha}{n} + \frac{1}{p}.$$
(5.3)

Then, $B^{\alpha \boldsymbol{a}}_{\tau,p}(\mathbb{R}^n) \hookrightarrow L^p(\mathbb{R}^n)$ and

$$\|f\|_{L^p(\mathbb{R}^n)} \lesssim \|f\|_{B^{\alpha a}_{\tau,p}(\mathbb{R}^n)}, \quad \forall f \in B^{\alpha a}_{\tau,p}(\mathbb{R}^n).$$
(5.4)

Proof. The proof relies on a sort of Bernstein inequality:

$$\|f\|_{L^{p}(\mathbb{R}^{n})} \leqslant C\lambda^{j\alpha} \|f\|_{L^{\tau}(\mathbb{R}^{n})}, \quad \forall f \in V_{j}^{(\tau)}.$$

$$(5.5)$$

Indeed, assume (5.5) for the moment and write every $f \in B^{\alpha a}_{\tau,p}(\mathbb{R}^n)$ as $f = P_0^{(\tau)}f + \sum_{j=0}^{\infty} Q_j^{(\tau)} f$. Then, Fatou's Lemma and Theorem 5.1 (with $\mu = \min\{1, p\}$) give

$$\begin{split} \|f\|_{L^{p}(\mathbb{R}^{n})} &\leq \left[\|P_{0}^{(\tau)}f\|_{p}^{\mu} + \sum_{j=0}^{\infty} \|Q_{j}^{(\tau)}f\|_{p}^{\mu} \right]^{1/\mu} \\ &\lesssim \left[\|P_{0}^{(\tau)}f\|_{\tau}^{\mu} + \sum_{j=0}^{\infty} (\lambda^{j\alpha} \|Q_{j}^{(\tau)}f\|_{\tau})^{\mu} \right]^{1/\mu} \lesssim \|f\|_{B^{\alpha\alpha}_{\tau,\mu}}. \end{split}$$

Now, if $\mu = p \leq 1$, this is the desired result. If p > 1, one must choose $1 \leq p_0 so that$

$$||f||_{p_i} \leq C ||f||_{B^{\alpha_i a}_{\tau 1}}, \quad i = 0, 1,$$

where α_i , p_i , τ are related as in (5.3). Using the real interpolation formula in Corollary 5.3 (and interpolation of L^p spaces) one establishes (5.4).

It remains to prove (5.5), which by scaling it suffices to do for j = 0. Let $f = \sum_k c_k \varphi_k$, for a finite sequence of scalars $\{c_k\}_k$. Then, the same argument we used in (3.2) involving reverse Hölder inequalities gives

$$\|f\|_{L^p(\mathbb{R}^n)}^p \leqslant \sum_{\gamma \in \mathbb{Z}^n} \int_{I_{\gamma}} \left| \sum_k c_k \varphi_k \right|^p \mathrm{d}x \lesssim \sum_{\gamma \in \mathbb{Z}^n} \left(\int_{I_{\gamma}} \left| \sum_k c_k \varphi_k \right|^{\tau} \mathrm{d}x \right)^{p/\tau} \lesssim \|f\|_{L^{\tau}(\mathbb{R}^n)}^p,$$

where in the last step we must use the inclusion $\ell^1 \hookrightarrow \ell^{p/\tau}$ (since $\tau < p$).

Remark 5.5. Below we will also need a local form of the previous embedding: there is a finite set $K_{\#} \subset \mathbb{Z}^n$ such that, for every $\gamma \in \mathbb{Z}^n$, we have

$$\|f\|_{L^p(I_{\gamma})} \lesssim \|f\|_{B^{\alpha a}_p(L^{\tau}(\tilde{I}_{\gamma}))}, \quad \forall f \in B^{\alpha a}_{\tau,p}(\mathbb{R}^n),$$
(5.6)

where $\tilde{I}_{\gamma} = \bigcup_{m \in K_{\#}} (I_{\gamma} + m)$. In the above expression the norm of $B_q^{\alpha a}(X)$ when X is a quasinormed space must be interpreted as follows:

$$\|f\|_{B_{q}^{\alpha a}(X)} = \|f\|_{X} + \sum_{|\boldsymbol{\ell}|=L} \left[\int_{\mathbb{R}^{n}} (|h|_{\boldsymbol{a}}^{-\alpha} \|\Delta_{h}^{\boldsymbol{\ell}} f\|_{X})^{q} \frac{\mathrm{d}h}{|h|_{\boldsymbol{a}}^{n}} \right]^{1/q}$$

To obtain (5.6) one can apply the previous corollary to the function Φf , where Φ is smooth and satisfies $\chi_{I_{\gamma}} \leq \Phi \leq \chi_{2I_{\gamma}}$. For a sharper version of this result, directly applied to Besov spaces over rectangles, see [16, Theorem 5.2].

6. The second theorem

In this section we prove Theorem 1.2, which gives a wavelet decomposition for the spaces $B^{\alpha \mathbf{a}}_{\tau,\tau}(\mathbb{R}^n)$ when $\alpha > n((1/\tau) - 1)_+$. Under this assumption, for any $0 < \tau < \infty$ we can define $p(\alpha, \tau) > 1$ by the identity (5.3), i.e.

$$p(\alpha, \tau) = \begin{cases} \left(\frac{1}{\tau} - \frac{\alpha}{n}\right)^{-1}, & \text{if } \alpha < n/\tau, \\ \infty, & \text{otherwise.} \end{cases}$$
(6.1)

It follows from Corollary 5.4, and the trivial embedding $B_{\tau,q}^{\alpha a} \hookrightarrow B_{\tau,q}^{\alpha_1 a}$ for $\alpha > \alpha_1$, that $B^{\alpha a}_{\tau \tau}(\mathbb{R}^n) \hookrightarrow L^p(\mathbb{R}^n)$ for every finite p such that $\tau \leq p \leq p(\alpha, \tau)$. In particular, for those p which are also greater than 1, every $f \in B^{\alpha a}_{\tau,\tau}$ can be decomposed as

$$f = \sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\varphi}_k \rangle \varphi_k + \sum_{\ell=1}^{m-1} \sum_{j=0}^{\infty} \left[\sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\psi}_{\ell;j,k}^{(p')} \rangle \psi_{\ell;j,k}^{(p)} \right] = \sum_{\ell=1}^{m-1} \sum_{j \in \mathbb{Z}} \left[\sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\psi}_{\ell;j,k}^{(p')} \rangle \psi_{\ell;j,k}^{(p)} \right],$$

with convergence of the series at least in $L^p(\mathbb{R}^n)$. Recall that the generating wavelets used in this paper ψ_{ℓ} , $\bar{\psi}_{\ell}$ are compactly supported, since they arise from scaling functions φ , $\tilde{\varphi}$, which are assumed to satisfy this property (see the references in [13, §3.2]).

Theorem 1.2 characterizes, among all functions with such representation, those having wavelet coefficients in ℓ^{τ} . We state below a stronger form of this theorem more akin to the notation in $\S5$, and with a few less restrictions in the indices. As usual, we shall assume that the scaling function $\varphi \in B^{\alpha_0 a}_{\tau,\tau}$, and that the space V_0 contains locally the polynomials of degree less than L.

Theorem 6.1. Let $0 < \tau < \infty$, $n((1/\tau) - 1)_+ < \alpha < \alpha^*$ and $p(\alpha, \tau)$ given by (6.1). Then, for any $p \in (1, \infty)$ such that $\tau \leq p \leq p(\alpha, \tau)$ we have

$$B_{\tau,\tau}^{\alpha a}(\mathbb{R}^{n}) = \left\{ f \in L^{p}(\mathbb{R}^{n}) : \|P_{0}^{(p)}f\|_{\tau}^{\tau} + \sum_{j=0}^{\infty} \lambda^{j\tau\alpha} \|Q_{j}^{(p)}f\|_{\tau}^{\tau} < \infty \right\}.$$

In this case, we have the equivalence of quasinorms:

$$\|f\|_{B^{\alpha a}_{\tau,\tau}} \sim \|P^{(p)}_0 f\|_{\tau} + \left[\sum_{j=0}^{\infty} \lambda^{j\tau\alpha} \|Q^{(p)}_j f\|_{\tau}^{\tau}\right]^{1/\tau} \quad \text{and} \quad |f|_{B^{\alpha a}_{\tau,\tau}} \sim \left[\sum_{j\in\mathbb{Z}} \lambda^{j\tau\alpha} \|Q^{(p)}_j f\|_{\tau}^{\tau}\right]^{1/\tau}.$$

Proof. We first prove the direct inclusion ' \subseteq '. The case $\tau \ge 1$ is just a reformulation of Theorem 5.1, since in this case the projectors are linear and $P_i^{(p)} = P_i^{(1)} = P_i^{(\tau)}$. We will assume, therefore, that $\tau < 1$, and fix a finite 1 . $Let <math>f \in B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n) \hookrightarrow L^p(\mathbb{R}^n)$. We first claim that $P_0^{(p)} f \in V_0^{(\tau)}$. Indeed, writing

 $P_0^{(p)}f = \sum_k \langle f, \tilde{\varphi}_k \rangle \varphi_k$ and using the embedding in (5.6) we have

$$|\langle f, \tilde{\varphi}_k \rangle| \leqslant \left[\int_{\operatorname{Supp} \tilde{\varphi}_k} |f|^p \, \mathrm{d}x \right]^{1/p} \|\tilde{\varphi}\|_{p'} \lesssim \|f\|_{B^{\alpha \boldsymbol{a}}_{\tau}(L^{\tau}(J_k))}, \tag{6.2}$$

where $J_k = J + k$ and $J = \text{Supp } \tilde{\varphi}$ is a fixed compact set. Then,

$$\sum_{k\in\mathbb{Z}^n} |\langle f,\tilde{\varphi}_k\rangle|^{\tau} \lesssim \sum_{k\in\mathbb{Z}^n} \|f\|_{B^{\alpha \boldsymbol{a}}_{\tau}(L^{\tau}(J_k))}^{\tau} \lesssim \|f\|_{B^{\alpha \boldsymbol{a}}_{\tau,\tau}(\mathbb{R}^n)}^{\tau},$$

which by the τ -stability of $\{\varphi_k\}$ implies that $P_0^{(p)} f \in V_0^{(\tau)}$ and

$$\|P_0^{(p)}f\|_{\tau} \sim \left[\sum_{k \in \mathbb{Z}^n} |\langle f, \tilde{\varphi}_k \rangle|^{\tau}\right]^{1/\tau} \lesssim \|f\|_{B^{\alpha a}_{\tau, \tau}}.$$

Next, we show that

$$\left[\sum_{j\in\mathbb{Z}}\sum_{\ell=1}^{m-1}\sum_{k\in\mathbb{Z}^n}\lambda^{\tau j(\alpha+n/2-n/\tau)}|\langle f,\tilde{\psi}_{\ell;j,k}^{(2)}\rangle|^{\tau}\right]^{1/\tau} \lesssim |f|_{B^{\alpha a}_{\tau,\tau}}, \quad \forall f\in B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n).$$
(6.3)

Since

$$Q_j^{(p)}f = \sum_{\ell,k} \langle f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle \psi_{\ell;j,k}^{(2)}$$

and $\tau < 1$, observe that we also have

$$\begin{split} \sum_{j\in\mathbb{Z}}\lambda^{\alpha j\tau} \|Q_j^{(p)}f\|_{\tau}^{\tau} &\leqslant \sum_{\ell,j,k}\lambda^{\alpha j\tau} |\langle f,\tilde{\psi}_{\ell;j,k}^{(2)}\rangle|^{\tau} \|\psi_{\ell;j,k}^{(2)}\|_{\tau}^{\tau} \\ &= \sum_{\ell,j,k}\lambda^{\tau j(\alpha+n/2-n/\tau)} |\langle f,\tilde{\psi}_{\ell;j,k}^{(2)}\rangle|^{\tau} \|\psi_{\ell}\|_{\tau}^{\tau}, \end{split}$$

so that (6.3) will suffice for the direct inclusion of the theorem.

To prove (6.3) we shall use the following estimate, valid for all $\alpha_1 < \alpha^*$ such that $n((1/\tau) - 1)_+ < \alpha_1 < n/\tau$:

$$\left[\sum_{\ell,k} \lambda^{\tau j(n/2 - n/\tau)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle|^{\tau}\right]^{1/\tau} \leqslant C \lambda^{-j\alpha_1} |f|_{B^{\alpha_1 a}_{\tau,\tau}}, \quad j \in \mathbb{Z}.$$
(6.4)

Assume for the moment that (6.4) holds and choose $\alpha_1 < \alpha$. Since $\langle \varphi_{j,k'}, \tilde{\psi}_{\ell;j,k} \rangle = 0$ for all ℓ , j, k, k', by definition of $P_j^{(\tau)}$ we must also have

$$\langle P_j^{(\tau)} f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle = 0, \quad \forall k \in \mathbb{Z}^n, \ j \in \mathbb{Z}, \ \forall f \in L^{\tau}(\mathbb{R}^n).$$
(6.5)

Combining (6.4) with Theorem 5.1 and using the fact $E_r^{(\tau)}(f - P_j^{(\tau)}f) \lesssim E_{\max(r,j)}^{(\tau)}(f)$, we obtain

$$\begin{split} \sum_{\ell,k} \lambda^{\tau j(\alpha+n/2-n/\tau)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle|^{\tau} &= \sum_{\ell,k} \lambda^{\tau j(\alpha+n/2-n/\tau)} |\langle f - P_j^{(\tau)} f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle|^{\tau} \\ &\lesssim \lambda^{j\tau(\alpha-\alpha_1)} |f - P_j^{(\tau)} f|_{B^{\alpha_1 \alpha}_{\tau,\tau}}^{\tau} \\ &\lesssim \lambda^{j\tau(\alpha-\alpha_1)} \sum_{r=j}^{\infty} \lambda^{r\tau\alpha_1} E_r^{(\tau)}(f)^{\tau}. \end{split}$$

Thus, summing this estimate in j and using Theorem 5.1 one more time we will have established (6.3):

$$\begin{split} \sum_{\ell,j,k} \lambda^{\tau j(\alpha+n/2-n/\tau)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle|^{\tau} &\lesssim \sum_{r \in \mathbb{Z}} \lambda^{r \tau \alpha_1} E_r^{(\tau)}(f)^{\tau} \bigg(\sum_{j=-\infty}^r \lambda^{j \tau (\alpha-\alpha_1)} \bigg) \\ &\lesssim \sum_{r \in \mathbb{Z}} \lambda^{r \tau \alpha} E_r^{(\tau)}(f)^{\tau} \sim |f|_{B_{\tau,\tau}^{\alpha \alpha}}. \end{split}$$

Let us now prove (6.4), which by homogeneity we just need to verify for j = 0. We let

$$p_1 = p(\alpha_1, \tau) = \left(\frac{1}{\tau} - \frac{\alpha_1}{n}\right)^{-1},$$

which by assumption is a real number in $(1, \infty)$. The proof will be a little more subtle than (6.2) above, since we want seminorms on the right-hand side. Observe first that by the local polynomial condition on V_0 the functions $\tilde{\psi}_{\ell}$ have vanishing moments up to degree L (see, for example, (6.5)). Thus, proceeding as in (6.2), we see that for every polynomial Q of degree less than L,

$$\begin{aligned} |\langle f, \tilde{\psi}_{\ell;k} \rangle| &= \left| \int_{\operatorname{Supp} \tilde{\psi}_{\ell;k}} (f-Q) \overline{\tilde{\psi}_{\ell;k}} \, \mathrm{d}x \right| \leqslant \|\tilde{\psi}_{\ell}\|_{p_1'} \|f-Q\|_{L^{p_1}(\operatorname{Supp} \tilde{\psi}_{\ell;k})} \\ &\lesssim \|f-Q\|_{L^{\tau}(J_k)} + |f-Q|_{B^{\alpha_1 a}_{\tau}(L^{\tau}(J_k))}. \end{aligned}$$

The difference operator Δ_h^{ℓ} with $|\ell| = L$, annihilates such polynomials, so the second term equals

$$|f - Q|_{B_{\tau}^{\alpha_1 a}(L^{\tau}(J_k))} = |f|_{B_{\tau}^{\alpha_1 a}(L^{\tau}(J_k))}.$$

For the first term we can choose $Q = Q^k$ as in Whitney's inequality, so that it easily follows that

$$|\langle f, \psi_{\ell;k} \rangle| \lesssim |f|_{B^{\alpha_1 a}_{\tau}(L^{\tau}(J_k))}.$$

Raising to the power τ and summing in $k \in \mathbb{Z}^n$, we end up with (6.4).

Let us now show the inverse inclusion of the theorem ' \supseteq '. By Theorem 5.1, the case $\tau \ge 1$ only requires verification that functions on the right-hand set belong to $L^{\tau}(\mathbb{R}^n)$. But this is immediate by Minkowski's inequality since

$$\|f\|_{\tau} \leqslant \|P_0^{(p)}f\|_{\tau} + \sum_{j=0}^{\infty} \|Q_j^{(p)}f\|_{\tau} \lesssim \|P_0^{(p)}f\|_{\tau} + \left[\sum_{j=0}^{\infty} \lambda^{j\tau\alpha} \|Q_j^{(p)}f\|_{\tau}^{\tau}\right]^{1/\tau},$$

where the last step follows by Hölder's inequality (since $\tau \ge 1$).

We are thus left with the case $\tau < 1$. By the assumptions on f (and $\lambda > 1$) we also see that

$$\|f\|_{\tau}^{\tau} \leqslant \|P_{0}^{(p)}f\|_{\tau}^{\tau} + \sum_{j=0}^{\infty} \|Q_{j}^{(p)}f\|_{\tau}^{\tau} \leqslant \|P_{0}^{(p)}f\|_{\tau}^{\tau} + \sum_{j=0}^{\infty} \lambda^{j\tau\alpha} \|Q_{j}^{(p)}f\|_{\tau}^{\tau} < \infty.$$
(6.6)

Next we shall establish a Bernstein-type estimate:

$$\|g\|_{B^{\alpha a}_{\tau,\tau}} \lesssim \lambda^{j\alpha} \|g\|_{\tau}, \quad \forall g \in V^{(p)}_j.$$

$$(6.7)$$

From here we can easily conclude the proof of the theorem since

$$|f|_{B^{\alpha a}_{\tau,\tau}} \leq |P_0^{(p)}f|_{B^{\alpha a}_{\tau,\tau}} + \sum_{j=0}^{\infty} |Q_j^{(p)}f|_{B^{\alpha a}_{\tau,\tau}} \leq \|P_0^{(p)}f\|_{\tau} + \sum_{j=0}^{\infty} \lambda^{j\tau\alpha} \|Q_j^{(p)}f\|_{\tau}^{\tau}.$$
(6.8)

Moreover, combining (6.3), (6.4) and (6.7) it is not difficult to also obtain the norm equivalences:

$$\|Q_j^{(p)}f\|_{\tau} \sim \left[\sum_{\ell,k} \lambda^{\tau j(n/2 - n/\tau)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)}\rangle|^{\tau}\right]^{1/2}$$

and

$$\left[\sum_{j\in\mathbb{Z}}\lambda^{j\tau\alpha}\|Q_j^{(p)}f\|_{\tau}^{\tau}\right]^{1/\tau}\sim |f|_{B^{\alpha a}_{\tau,\tau}}.$$

To prove (6.7) we shall assume j = 0 and proceed as in Bernstein's inequality:

$$|g|_{B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n)}^{\tau} \leqslant |\varphi|_{B^{\alpha a}_{\tau,\tau}}^{\tau} \sum_{\gamma \in \mathbb{Z}^n} |\langle g, \tilde{\varphi}_{\gamma} \rangle|^{\tau} \lesssim \sum_{\gamma \in \mathbb{Z}^n} \int_{\operatorname{Supp} \tilde{\varphi}_{\gamma}} |g|^{\tau} \, \mathrm{d}x \lesssim \|g\|_{L^{\tau}(\mathbb{R}^n)}^{\tau},$$

where in the second step we have used the reverse Hölder inequality in $V_0^{(p)}|_{\text{Supp }\tilde{\varphi}_{\gamma}}$. The proof of the theorem is now complete.

As a simple corollary we obtain a slight sharpening of (5.4).

Corollary 6.2. Let $0 < \tau \leq 1$, $n((1/\tau)-1) < \alpha < n/\tau$ and $p = p(\alpha, \tau)$ given by (6.1). Then,

$$\|f\|_{L^p(\mathbb{R}^n)} \lesssim |f|_{B^{\alpha \boldsymbol{a}}_{\tau,\tau}(\mathbb{R}^n)}, \quad \forall f \in B^{\alpha \boldsymbol{a}}_{\tau,\tau}(\mathbb{R}^n).$$

Proof. Choose very smooth scaling functions so that $\alpha^* > \alpha$. Since by assumption $f \in B^{\alpha a}_{\tau,\tau} \hookrightarrow L^p$ and $p \in (1,\infty)$, we can write

$$f = \sum_{j \in \mathbb{Z}} Q_j^{(p)} f = \sum_{j \in \mathbb{Z}} \left[\sum_{\ell=1}^{m-1} \sum_{k \in \mathbb{Z}^n} \langle f, \tilde{\psi}_{\ell;j,k}^{(2)} \rangle \psi_{\ell;j,k}^{(2)} \right]$$

with convergence of the series at least in L^p . Then, using Minkowski's inequality, relation (6.1) and the embedding $\ell^{\tau} \hookrightarrow \ell^1$ we obtain

$$\begin{split} \|f\|_{p} &\leqslant \sum_{j \in \mathbb{Z}} \|Q_{j}^{(p)}f\|_{p} \lesssim \sum_{\ell,j,k} \lambda^{j(n/2-n/p)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)}\rangle| \\ &\lesssim \left[\sum_{\ell,j,k} \lambda^{\tau j(\alpha+n/2-n/\tau)} |\langle f, \tilde{\psi}_{\ell;j,k}^{(2)}\rangle|^{\tau}\right]^{1/\tau}. \end{split}$$

By Theorem 6.1, when $f \in B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n)$ this last expression is equivalent to $|f|_{B^{\alpha a}_{\tau,\tau}(\mathbb{R}^n)}$, establishing the corollary.

7. Final comments and further remarks

We conclude the paper with several remarks about limitations and possible extensions of the results presented above.

7.1. More general wavelet bases

The use of compactly supported wavelets and scaling functions is a typical requirement in problems arising from numerical applications. In our results above this assumption was used at several crucial points, in particular when dealing with the nonlinear projectors $P_j^{(p)}$. This is actually a quite common procedure in approximation theory (see, for example, $[\mathbf{4}, \mathbf{6}, \mathbf{7}]$), although it is still fair to ask what happens with wavelet bases having more general decay conditions. We will not pursue this question here, but we stress that a main difference appears when p < 1 and $\alpha < n((1/p) - 1)$, since the Besov spaces introduced above *are not distribution spaces*. There is a rich literature on Besov spaces defined from Littlewood-Paley theory (especially in the isotropic setting (see, for example, $[\mathbf{2}, \mathbf{18}, \mathbf{20}]$), but the techniques used in such cases seem too restrictive to be applied here. We think this is an interesting question left to future research.

7.2. Other dilation matrices

As was pointed out above, the theory of multi-resolution analyses has only been developed for dilation matrices M with integer entries. This produces some limitations if one wishes to study anisotropic spaces, since, for instance, diagonal integer matrices of the form in (1.1) will only exist when

$$\left(\frac{1}{a_1},\ldots,\frac{1}{a_n}\right) \in \mathbb{R}_+ \log \mathbb{Z}_+^n$$

(see [13, §3.3]). In applications this does not seem to be a serious restriction, since one can at least cover all the cases $a \in \mathbb{Q}_+^n$. However, if one wishes to analyse more-general anisotropic spaces, then the traditional MRA setting must be abandoned.

An alternative approach for function spaces in the cube $[0, 1]^2$ was developed by the second author in [16]. If $\mathbf{a} = (a_1, a_2)$ is a general anisotropy in \mathbb{R}^2 with $a_1 \ge a_2 > 0$ and $\{V_j\}_{j=0}^{\infty}$ is a *one-dimensional dyadic MRA in* $L^2(\mathbb{R})$, then one can consider an adapted subcollection of two-dimensional tensor-product spaces:

$$\mathcal{V}_{j,\boldsymbol{a}} := V_j \otimes V_{[ja_1/a_2]}, \quad j = 0, 1, 2, \dots,$$

where [s] denotes the integer part of s. Roughly speaking, the factor a_1/a_2 gives the proportion of 'extra details' we need to consider in the x_2 -variable every time we change scale in the x_1 variable. This produces a multilevel decomposition based on $\{\mathcal{V}_{j,a}\}_{j=0}^{\infty}$ which is well adapted to the study of anisotropic spaces $B_q^{\alpha a}(L^p[0,1]^2)$. A similar approach has also been developed more recently in [19].

7.3. Nonlinear approximation spaces

Our last remark concerns the characterization of anisotropic Besov spaces as nonlinear approximation spaces. For this one defines a new approximating family Σ_N , consisting of all $S = \sum_k c_k \varphi_k + \sum_{j=0}^{\infty} \sum_{\ell,k} d_{\ell;jk} \psi_{\ell;j,k}$ with at most N non-null entries. If we

denote the error of approximation by $\sigma_N(f)_p = \inf_{S \in \Sigma_N} ||f - S||_p$, then, similarly to the isotropic setting [11], one would like to show

$$B_{\tau,\tau}^{\alpha \boldsymbol{a}} = A_{\tau}^{\alpha}(L^p; \Sigma_N) := \left\{ f \in L^p : \sum_{j=0}^{\infty} 2^{j\alpha\tau} \sigma_{2^j}(f)_p^{\tau} < \infty \right\}, \quad \text{if } p = p(\alpha, \tau).$$

Such a result (more subtle than the ones in this paper) has been investigated independently in [16] and [19], both with the multilevel decomposition for $[0, 1]^2$ described in § 7.2. A characterization in the general MRA setting of this paper will be presented separately in [12].
