Occ. Publ. Br. Soc. Anim. Sci. No. 28

Foreword

Sustainable Livestock Production requires that tight product specifications are met profitably while environmental impact is minimised and welfare promoted. These requirements may conflict and the inevitable compromises merely release the immediate pressure while avoiding a long term solution. Other industries have successfully resolved similar tensions by the application of process control techniques. This conference focussed on this approach, termed integrated management systems (IMS) for livestock.

Integration takes several forms in IMS. First, the development of IMS couples the biological understanding of the animal scientist with the technology of the agricultural engineer: the conference was held under the aegis of the British Society of Animal Science and the Institution of Agricultural Engineers with generous sponsorship from Tesco PLC, the Department for Environment, Food and Rural Affairs, and the Meat and Livestock Commission. Secondly, control of livestock production involves consideration of biological, chemical and physical processes over various time-scales. Finally, the practical application of IMS on the livestock farm needs close co-operation between the potential manufacturer of the control systems, the research engineers and scientists and the farmers, all of whom have an important, vital role to play.

The conference coincided with a period of active debate between the newly elected UK Government and other stakeholders about the future of livestock production; BSE, Foot and Mouth disease, the welfare of intensively farmed animals, climate change, environmental pollution and other concerns were foremost in the delegates' minds. While the conference's timing was fortuitous to some extent, integrated management systems may prove to be one means to cope with the complexities of livestock production in the 21st Century.

The final session considered research needs and commercial opportunities for IMS – a brief report on the breakout and summary sessions is available from the convenor.

Contents

OFFERED PAPERS

Livestock production in the 21st Century

The future for the livestock industry after foot and mouth <i>M. Palmer</i>	1
Environmental impacts of livestock production <i>T. R. Cumby and V. R. Phillips</i>	13
Green engineering for livestock production systems <i>M. Kelly and J. E. L. Boyd</i>	23
Bioethical analysis of biotechnologies: lessons from automatic milking systems (AMS) and bovine somatotrophin (bST). <i>K. M. Millar, and T. B. Mephram</i>	29
Biosensors for livestock production <i>K. C. Persaud</i>	37
An overview of integrated management systems for sustainable livestock production <i>A. R. Frost</i>	45

Dairy Cows

A vision of dairy production in the UK <i>C.H. Knight</i>	51
Life-time organisation and management of reproduction in the dairy cow <i>D. C. Wathes, D.E. Beever, Z. Cheng, P.G.A. Pushpakumara and V.J. Taylor</i>	59
Nutritional and grazing management of the dairy cow <i>R. J. Dewhurst, S. M. Rutter and A. J. Rook</i>	71
Dumb animals and smart machines: the implications of modern milking systems for integrated management of dairy cows <i>T. T. Mottram, L. Masson</i>	77

Pigs

A vision of pig production in the UK <i>J. Carr</i>	85
Nutrition management of growing pigs <i>C. T. Whittemore, D. M. Green and C. P. Schofield</i>	89
Environmental design for pig welfare <i>V Beattie</i>	97
Engineering technologies enable real time information monitoring in pig production <i>N. Bird, H. G. Crabtree and C. P. Schofield</i>	105

The future of livestock production

- The future of livestock production: planning for the unknown 113
A.J.F. Webster

Poultry

- A vision of poultry production in the UK 119
G. C. Perry
- Environmental enrichment for poultry welfare 125
R.B. Jones
- Nutritional management of meat poultry 133
D Filmer
- Applications of process control techniques in poultry production 147
J.-M. Aerts, C. M. Wathes, D.Berckmans

POSTERS

- Monitoring wild fauna fertility non-invasively 155
G. Caplen, T.T. Mottram, A. Pickard and S. Milligan
- Within milking variation of urea, acetone, fat and protein and the determination of sampling time for an on-line system 157
L.L. Masson T.T. Mottram, and P.C. Garnsworthy
- Effect of replacing rolled wheat with a moist food co-product on the yield and composition of milk from Holstein Friesian dairy cows fed a grass silage based diet 159
A S. Chaudhry, W. Taylor and P. Rowlinson
- Some metabolic and productive responses of growing Japanese quail as affected by dietary thyme, dianthus and fennel 165
S. A. Abd El-Latif
