Ethical codes and corporate responsibility of the most admired companies of the world: Toward a third generation ethics?

Abstract: Codes of ethics contain a set of rules of conduct and corporate principles concerning the responsibility of a company to its stakeholders and shareholders. These codes help to guide corporate and employee behavior, and constitute verifiable elements of social responsibility. This study examines the *Most Admired Companies of the World*, ranked by *Fortune* magazine in 2009 to find out, first, whether their codes of ethics exhibit greater emphasis on social responsibility and strong implementation processes, and second, whether they could be considered codes of the third generation as elaborated by Stohl et al. in their article in the *Journal of Business Ethics*. Our results indicate that the codes of ethics of the 2009 *Most Admired Companies of the World* resemble “codes of conduct” rather than strictly codes of ethics or “codes of corporate social responsibility”. These codes continue to be governed by traditional norms related to immediate economic success, normative compliance, internal management and the pressing effects of their sector. This study thus provides empirical support for the idea that the philosophy of corporate social responsibility (CSR) is scarcely present in the codes of the most reputable companies.

1 Introduction

Corporate codes have proliferated over the last decades of the 20th century, prompted by financial and business scandals.¹ Today most of the biggest corporations

¹ Stevens 1994; Cowton and Thompson 2000.

in the world have a code, and the percentage is rising.² This interest in codes has grown simultaneously with the attention on corporate social responsibility and sustainable business practice in big corporations.³ Codes of ethics show corporate responsibility sensibility, or at least they are the most objectively verifiable elements of social responsibility.⁴

Given the growing concern for social responsibility and for forging relationships with external stakeholders – both of which have become an undeniable social demand – it is reasonable to think that the content of the codes of the most respected and admired companies should reflect this trend.

By definition, admiration indicates that corporate actions and behaviors are estimated as distinguished, which supposes credibility, a long-term positive image and reputation, and therefore the adherence to values and principles.⁵ In theory, admiration comes from actions and not from the codes themselves, although these values are usually described in business codes.⁶ Moreover, the content of the code constitutes the basis for defining the indicators for measuring its effectiveness, and also influences the ethical or unethical behavior within companies.⁷ Codes are usually regarded as the most important component of an ethics program in companies.⁸ They are useful tools for stating ethical principles as well as for communicating to its audience the importance the company gives to these principles as necessary conditions for doing business.⁹ Hence codes are an essential tool to make a company ethical and an important step for corporate image.¹⁰

In this article we examine the codes of ethics of the *Most Admired Companies of the World*, ranked by *Fortune* in 2009, to analyze whether their thematic contents are focused on global, social and environmental aspects of corporate responsibility; that is, whether they exhibit a greater concern for their relations with external stakeholders, or whether by contrast they are still anchored exclusively in shareholders' and internal stakeholders' interests.

The *Fortune's* ranking was created by asking business people to vote for the companies that they admired most from any sector of activity. Since this ranking has remained stable throughout the financial crisis period, the analysis of the

content of their codes can offer valuable information about how to preserve reputation, and consequently, admiration, even in times of crisis.¹¹

In their article, Stohl et al. (2009) distinguish among three generations of codes in relation to the process of globalization. The first generation focuses on the legal dimension of corporate behavior. It encourages being consistent with the law and addressing overall legal issues and international regulations, while maximizing returns to the shareholders of the company.¹² The second generation of codes is more proactive, and focuses on issues concerning internal stakeholders, more specifically on how “the company must improve the lives of employees and their families through education, insurance, pensions, social security, freedom from harassment, etc., rather than simply keeping the workers from being hurt”.¹³ Finally, the third generation (3G) should “transcend the profit motive and the enhancement of stockholder positions and the protection of employees and should include a greater consideration of external global stakeholders”.¹⁴ Third generation ethics are grounded in responsibilities to the larger interconnected environment and the larger community in which companies operate.¹⁵

These three generations of codes should not be understood as being mutually exclusive or a zero sum game. Instead, it is illustrative to picture them as concentric circles so that each category contains previous ones. Hence, we think that it is reasonable to expect that the codes in our sample will show features of 3G codes, together with characteristics of the other two generations of codes. As such, we attempt to answer the following research question:

Do the most admired companies of the world have codes settled on social, global and environmental aspects of corporate responsibility, paying attention to external stakeholders beyond just shareholders and internal stakeholders?

Our purpose is to analyze whether the codes of the most reputable companies have evolved along the same path as the public demand, which calls for more social responsibility, or whether they are still stuck on a regulatory and legal stage.

We proceed as follows. First, we briefly address the literature’s findings on the codes’ content and we relate them to the three different generations defined by Stohl et al. (2009). Then we continue by presenting our sample, the data, and the methodology used for collecting and processing the information, followed

¹¹ All of the companies ranked in 2008 continued in 2009, and 90.2% maintained their position in 2010, including several US financial companies such as *Goldman Sachs* or *American Express*.

by the presentation of our findings. We conclude by providing final remarks and identifying those areas that call for further research.

2 Evolution of codes of ethics: a thematic overview

Business codes of ethics are written as formal documents which include a set of moral standards and corporate principles, as well as rules of conduct or company philosophy concerning the responsibility to stakeholders and shareholders, which help guide corporate behaviour and employees' conduct.¹⁶

Corporate codes have proliferated over the past two decades, with an initial prominence in the USA.¹⁷ In their survey of large American corporations included in the *Fortune 1000* in the mid-1990s, Weaver et al. (1999) find that 78% of companies have an ethical code. Kaptein (2004) obtains that 58% of the world's largest 100 companies have such a document in place. The percentage is lower in the UK (57%), Germany (53%), France (30%) and other European countries.¹⁸ In general, countries of Continental tradition have developed codes later than those of Anglo-Saxon tradition, but a high proportion of large European corporations are developing some sort of ethical code, and the flow continues also in Asian countries,¹⁹ sometimes prompted by their stakeholders and other times by legal requirements.²⁰

With respect to the history of corporate codes, we can distinguish three phases according to the prevalence of shareholders, internal stakeholders and external stakeholders.

The first phase or generation focuses on the protection of individuals from organizational wrongdoing by virtue of the corporate legal compliance and non-violation of the legal context. The strict fulfillment of law and rules constitutes an important issue for corporations for two reasons: first, non-fulfillment can result in direct economic losses and the assumption of highly expensive penalties; and second, the damage to the corporation's image can create long-term costs. This concern has been translated to codification.

Examining the literature in these terms, it seems evident that codes from the 1980s and 1990s should be generally categorized as first generation. Benson

¹⁶ Kaptein and Schwartz 2008.

¹⁷ Adams and Rachman-Moore 2004.

¹⁸ Schwartz 2002.

¹⁹ Calderón et al. 2009.

²⁰ Waddock et al. 2002.

and Ross (1998) argue that the largest corporate codes of the 1980s are mainly legalistic or regulatory, although this vision can actually be extended to the next decade. In the USA, codes have been the needed answer to legislative and regulatory development. Many of these codes were strongly concerned with self-protection after the Watergate Scandal and the passage of the Foreign Corrupt Practices Act in 1977, and it is clear that they also increased largely with the Enron scandal and the proclamation of the Sarbanes-Oxley Act in 2002.

Cressey and Moore (1983), in their survey of 119 US corporations' codes, examine policy areas, authority and compliance, and criticize the lack of attention to social responsibilities and the emphasis on a regulatory focus. The authors find that, with respect to the policy area, the priority is minimizing conduct against the firm instead of actions directly affecting the public. Studies from that time show unanimously that conflicts of interest are a common theme.²¹ Lefebvre and Singh (1992), in their questionnaire-based study in *The Financial Post's Top 500 Canadian Corporations*, find that issues included in the category "Behavior against the Firm" are more frequently and extensively addressed than issues related to conduct on behalf of the companies. As Farrell et al. (2002) point out, in most cases codes tend to follow a criminal law structure, focusing on rule-based statement, while values are absent.

In their analysis of European corporations, Langlois and Schlegelmilch (1990) emphasize that codes tend to have "conduct" in the name and content rather than "ethics". Studying the codes of large Spanish corporations listed in Madrid Stock Markets, Rodríguez-Domínguez et al. (2009) find that their nature is mainly prescriptive and their main concerns have to do with the adherence to law.

The second stage or generation of codes extends the focus toward the relationship with internal and direct stakeholders. Predominantly it looks at behavior exhibited by groups directly associated with the corporation, especially employees. Even though the relationships with law and government still persist, codes remind us that the corporation presents a moral responsibility with stakeholders, individuals who have been impacted by corporate decisions.²²

In this last sense, the literature underlines the prominence of the insiders, particularly of the employees. Weaver (1993) affirms that employee rights receive more attention than issues regarding company relations with other parties or the society. This is in line with the analysis of Béthoux et al. (2007), that find that the main target is employees, both as assurers of the implementation of the code and as protectors

²¹ Chatov 1980; White and Montgomery 1980; Arthur 1984; Sanderson and Varner 1984; Stevens 1994.

²² Cressey and Moore 1983.

of the assets of the company.²³ Regional and cultural factors must again be considered. For instance, Langlois and Schlegelmilch (1990) found differences between the European and American codes in relation to employees. European companies emphasized employee responsiveness to company activities, while US firms stressed company responsiveness to employee requirements of fairness and equality.

The third generation of codes is triggered by globalization. This generation “establishes standards of ethical performance in relation to global stakeholders and the larger world community, transcending traditional organizational boundaries and the limited view that ethical and legal are synonymous”.²⁴ In this recent complex context, writing a code also offers a possibility to show a coherent moral image. When operating in very different countries and facing new cross-cultural ethical challenges, international corporations must look for systems that permit transcending differences and transmitting a well-founded core of principles and behavioral standards²⁵ shared by corporations and individuals.²⁶

Preuss (2010), after analyzing the codes of FTSE100 companies, points out that large corporations cannot help accepting a greater responsibility for a range of ethical, social and environmental issues. However, Stohl et al. (2009: p. 619) expose an intriguing regional difference: “nearly 88% of European companies have third generation thinking present in their codes, and, on average, 13% of sections within their codes reflect the third generation ideas, whereas in the USA, only 75% of companies have third generation thinking embedded in their codes”.

3 Research methodology and results

3.1 The sample

Our sample is the 50 *World's Most Admired Companies* ranked by *Fortune* (2009). Companies were selected on the basis of nine key attributes of reputation, such as innovation, people management, use of corporate assets, quality of management, financial soundness, long-term investment, quality of product and global competitiveness. The sample is presented in Table 1. After the name of the company, the first column details its position in the 2009 ranking. The figure in brackets corresponds to the position in the 2010 ranking based on preliminary data. As can be seen, only 10% of the companies disappear in the 2010 ranking and two of

them lose more than 10 places. The second column indicates those areas where the company is far away from the leader in its sector, occupying a fifth position or beyond. The number in parentheses indicates the actual position. For example, Southwest Airlines received the grade GC (11) indicating that it is ranked number eleven in its sector for Global Competitiveness. A score of “Excellent”, which appears for four companies, is obtained when the company is ranked the first in its sector. The third column indicates the distance in percent from the score of the leader of the correspondent sector; the rate is negative if the corporation is below the leader. The following three columns show the position in 2009 in *Fortune 1000*, in the case of US companies and in *Fortune 100 Best Place to Work* and the *Global 500* annual ranking.

With respect to origins, several authors emphasize the importance of national identity.²⁷ In our sample, most of the companies with a code are headquartered in the USA. (82%), while 12% are located in Asia and 6% are European companies (see Table 2). The overwhelming majority of US companies in our sample suggests the need for caution in the generalization of the conclusions from a regional analysis. The sample used in the study is not meant to be representative of the overall population; rather, it has been carefully chosen to provide us with a picture of the most admired corporations. Our aim is not to gather information on a random sample to then make inferences about a larger

*This year companies whose industry scores are equal when rounded to two places will receive the same rank, i.e., they will tie. In cases of ties, companies are listed in alphabetical order.

population, but rather to carefully describe a relevant set of firms selected for a particular characteristic: the most admired companies. This is in line with the work of other authors in the literature such as Weaver et al. (1999) and Hassink et al. (2007).

The sample covers a wide range of sectors: new technologies, banking and financial services, motor, pharmaceutical and cosmetics, general merchandising, etc. (see Table 2). New technology companies are the most prominent (24%), followed by banks, financial and infotech service-providers and insurance corporations (17%), and general merchandisers and specialty retailers (13%). Again, the size of the sample asks for caution in the conclusions related to sector criteria.

To construct the sample we downloaded the codes of ethics from the corporate websites of the selected companies. In every case we selected the English version, as it is currently the dominant language of the Internet and in business activity worldwide. In general, these websites provide sufficient information about CSR activities, annual reports and other documents. In fact, the Internet acts as one of the most important disseminators of corporate information and also as a mirror of the company. However, given that the codes try to set out general principles to which the company intends to adhere – what it sees as its

core assets²⁸ – we believe they should include the existing awareness on social responsibility.

4 Methodology

After collecting the codes from the corporate websites, four companies listed in *Fortune's* 2009 ranking fell out of the sample because they had not developed a code that was accessible online.

In order to analyze the remaining 46 codes under the three generations scheme proposed by Stohl et al. (2009), we classified their content according to five basic dimensions: ethics and corporate culture, regulation and compliance, stakeholders and internal organization, community and implementation.

To justify the choice of these five categories, it is illustrative to review the criteria adopted in other research articles. For the last few decades, the literature has basically followed variations in the methodology described in the seminal work by Cressey and Moore (1983), who classify the contents of codes of ethics within the following three subjects: policy area (conduct against and behalf of the firm, and book and records' integrity), authority (principles morally needed for ethical legitimization), and compliance procedures. For instance, Mathews (1987) describes 10 major areas: (i, ii) conduct on behalf of and against the organization, (iii) integrity of books and records, (iv) basis of the code, (v, vi) specific and American legal adherence, (vii, viii) enforcement practices and procedures, (ix) penalties and (x) reputation references. Lefebvre and Singh (1992), which is taken as a base in Wood (2000), catalog four main groups: general information [which includes (x)], types of conduct addressed [which contain elements (i) through (vi)], enforcement and compliance procedures [which coincides with (vii) plus (viii)], and penalties [which corresponds to (ix)]. Furthermore, Kaptein (2004) classifies contents according to: stakeholder responsibilities, stakeholder principles, corporate values, internal employees conduct and implementation. Hence, the choice of the five categories listed above seems suitable for the purpose of our study and it is aligned with the literature on codes of ethics.

In order to construct our dataset we measure the importance of each of the five categories by the amount of space (fraction over the total) devoted to each item. This is done by contrasting the number of text lines dedicated to a given category with the total number of text lines of the whole code, to obtain the corresponding percentage. These percentages, summarized in Figure 1, will allow us to categorize the codes of the most admired companies ranked by *Fortune* as belonging to the first, second or third generation of codes.

28 Béthoux et al. 2007.

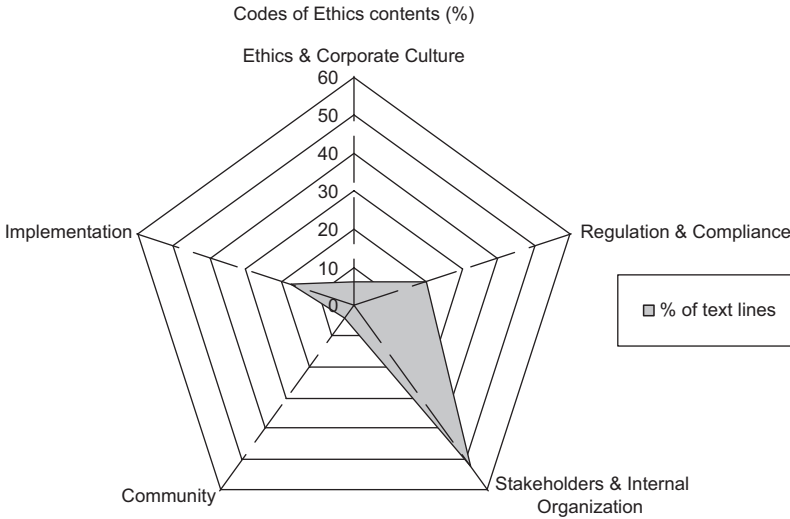

Figure 1 Codes of ethics contents (%).

4.1 Results

According to our data, 46 corporations (92%) have developed a code of ethics that is accessible through their webpage, and four (two from the USA and two from Asia) have not. This is a significant proportion in relation to Kaptein (2004), who finds that 58% of the 100 largest corporations in the world have a code. However, business codes are more prevalent among US companies, where this percentage increases to 71%. This is in consonance with Weaver et al. (1999). It is important to acknowledge that the lack of the code on corporate websites does not imply its inexistence, but it is a significant signal of its relevance for the company.

Considering the 46 codes of ethics in our sample, we analyzed and classified their content according to the five categories that have already been mentioned:

(1) Ethics and corporate culture

This category includes the values and principles of the company, as well as several universal moral standards, including trustworthiness, respect, responsibility, fairness, caring and citizenship,²⁹ that guide the relationships with stakeholders.³⁰ Kaptein (2004) lists as more frequent values such as transparency, honesty and fairness. Nevertheless, we are less interested

²⁹ Schwartz 2002.

³⁰ Kaptein and Wempe 2002.

in the principles themselves than in the importance (deficit or surplus) that principles have in the codes of these companies. Nevertheless, culture and core values can be very important in building a reputation, and even in restoring lost reputation.³¹

Our data show that these values are not mentioned very frequently; only 6.17% of the content is devoted to ethics and corporate culture. The proportion is relatively small for American corporations (6.01%) in comparison to Asian (6.67%) and European companies (7.15%) (see Table 3). With respect to sectors, industrial and farm equipment exhibits the greatest concern for ethics and corporate culture (13.09%), followed by hotels and entertainment (8.84%). In contrast, the pharmaceutical and cosmetics sector devotes the least attention to these issues (0.90%) (see Figure 2).³²

(2) Regulation and compliance

This category comprises aspects related to public administrations and regulators. The goal of this type of content is to protect individuals from organizational wrongdoing by virtue of the corporate legal compliance and the non-violation of the legal context. As it has already been exposed, this normative dimension has been highlighted by most of the studies from early literature.³³ The outstanding space dedicated to the adherence to law and regulation will show the weight of the first generation component in the codes.

Lefebvre and Singh (1992) find that legal responsibility is a “non discussed” content in 68% of cases, “discussed” in 29.3% and “discussed in detail” in 2.7%. Nevertheless 12% of the codes make emphatic references to competition and antitrust law. Moreover, insider-trading information is emphasized in 44% of the cases. Kaptein (2004) finds that the degree in which “observing, both directly and indirectly, all relevant local law and regulations” is mentioned in 57% of the codes. Preuss (2010) finds that 100% of codes of ethics and 92% of codes of conduct mention compliance with legislation. In our study 100% of the codes mention it. We include in this section types of conduct that can violate law and regulations: divulgence of secrets or trade information, corruption and bribery, money laundering, integrity of books and records, accountability and auditing, fraud, insider trader

³¹ Rhee and Valdez 2009.

³² Liker (2004) shows that Toyota’s reputation is built through a multidimensional model in which organizational culture is prominent. However, in our data, its organizational culture captures only 3.03% of the total of its code ethics. In the motor sector Honda doubles this value by large (7.07%). As Rhee and Valdez (2009) argue, Toyota combats vulnerability more through the compliance with the standards of quality of products rather than through a call on its institutional prestige.

³³ Chatov 1980; White and Montgomery 1980; Sanderson and Varner 1984; Matthews 1987.

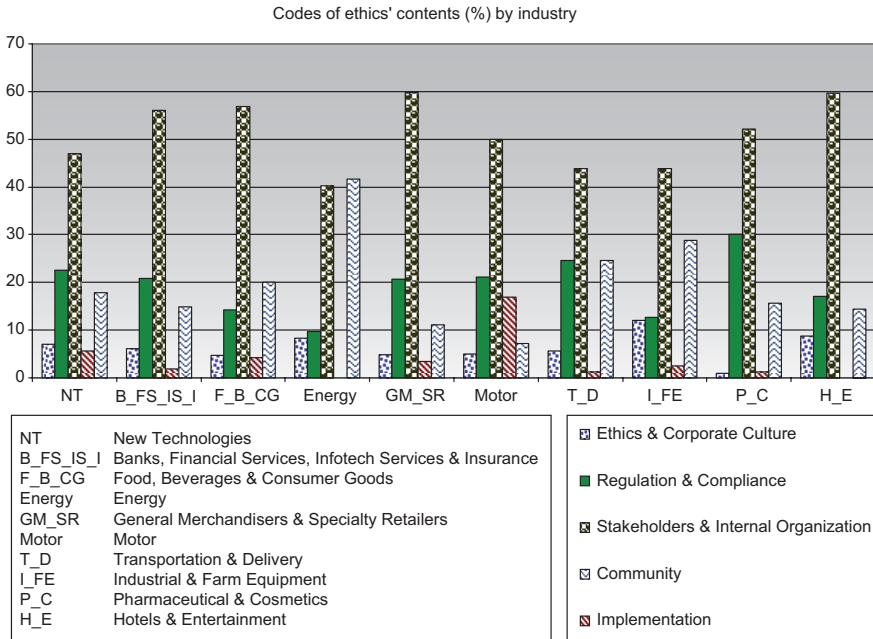

Figure 2 Codes of ethics' contents (%) by industry.

information, legal international trade framework, and conducts in relation with political activities of employees and managers. Our data show that, in 2009, codes of ethics still have a strong regulatory base (19.99%). However, a notable divergence across sectors must be highlighted: pharmaceutical and cosmetics (30.13%), transportation and delivery (24.65%), and new technologies (22.60%) show the greatest concern for regulation and compliance as opposed to energy (9.72%), which shows the smallest rate.

Taking into account the frequent attention devoted to regulation and compliance in the codes of the most admired corporations, it is possible to state that they still exhibit a strong first generation component (see Figure 1) as two out of each 10 lines refers to this issue (see Table 3).

(3) Stakeholders and internal organization

This section contains standards and norms of conduct for employees, including health and safety, alongside references to shareholders, clients, suppliers and competitors.

We observe in our data that codes show a strong focus on internal organizational rules (32.84% of the content), while the relationships with stakeholders in general receive relatively little attention (19.32%) (see Figure 1). In fact, internal organization (which includes drugs, harassment,

racial and sexual discrimination, use of assets, confidential information, gifts and external works) is the topic that covers the largest share of the code's content. On the contrary, the treatment of direct stakeholders is poor. As in the cited literature, employees are those who receive the highest interest (7.47%) followed by clients (4.38%), competitors (3.15%), suppliers (2.80%), and shareholders (1.53%), who receive the least consideration (see Table 4).

It is important to note that most of the text devoted to stakeholders is indirectly aimed at the employees, indicating to them, more or less explicitly, how to behave with the other stakeholders. Béthoux et al. (2007) find that workers are potentially guilty of infringing the code and as the first line of monitors of its effectiveness. This attention serves a dual purpose: to ensure good working conditions and respect for basic rights of employees (this point is captured by the caption "Employees"), and also to recommend, or more frequently to demand, criteria and behaviors aligned with the code (what is collected under the heading of "Internal Organization"). In fact, the space that both concepts receive in the codes on average is 40.31% of which 32.84% is attributed to "Internal Organization." Therefore, it seems clear that the codes exhibit a strong normative dimension. Indeed, one of the essential purposes of these documents is to ratify the legal compliance standards and provide additional internal criteria. In this sense, it is possible to affirm that the codes of the most admired corporations continue to have a strong second generation character. Four out of each 10 lines refer to the employee's behavior both as an independent individual and as a part of the organization (see Figure 1).

(4) Community

This category includes social and environmental issues and the corporate relationship with society and the international community. This field corresponds to what Stohl et al. (2009: p. 607) call the "larger interconnected environment" and it is a distinctive feature of the third generation of codes of ethics.

The conduct on behalf of the firm in relation to the world community has traditionally been low. Kaptein (2004) finds that there is high degree of mention of natural environment (56%) and community affairs (36%), including charitable donations, educational and cultural contributions and employee participation in community and civil affairs. Lefebvre and Singh (1992) point out that "civic and community affairs" and "environmental affairs" are emphasized in 9.3% of the codes of ethics and in 6.7% of the codes of conduct. With the examples of Nestlé and Shell, Béthoux et al. (2007)

Table 4 Codes of ethics' contents: stakeholders.

	% of text lines stakeholders						
	Employees	Clients	Competitors	Suppliers	Shareholders	Total

Total	7.47	4.38	3.15	2.80	1.53	19.32	

conclude that environmental protection is closed around the corporation's self-interest in preventing the basis of its own activity.

It is worth highlighting the low attention paid in our sample to the social dimension of corporate responsibility: the relationship of the company with society and the environment. The space devoted to these issues in general amounts to 4.16% of the whole code. Strictly speaking, the concern for relations with society is even lower than what our numbers suggest (2.18%), since they include references to corporate performance criteria in terms of contributions to political parties and electoral campaigns. This weak concern for the community proves that the priority of the codes of ethics is basically the internal issues of the company, and when it comes to external relationships, corporations care more for the economic impact rather than for the environmental impact, direct or indirect.

The exception is found in the motor sector, in which companies dedicate 16.83% of the content of their codes of ethics to the community. However, these results should be interpreted with caution since this sector is composed mainly of Asian companies, which exhibit great concern for community issues; this includes Toyota Motor (26.67%) and Honda (19.35%). In the case of Asian corporations, the fraction of codes devoted to community matters is 17.35%, whereas for European companies it is 6.36% and only 2.64% for US corporations. (see Figure 3).

(5) Implementation

This category addresses the criteria for the implementation of the codes of conduct, which has been described as a sign of the code's quality.³⁴ Thorne and Saunders (2002) and Langlois and Schlegelmilch (1990) recognize that even if the content of the code is not in conflict with basic values, the implementation process is not universal. Helin and Sandström (2008) argue that implementation is a major concern and challenge of setting a code, especially when considering how to apply a code to worldwide subsidiaries with managers responsive to the norms in the local context.

Kaptein (2004) finds that a quarter of the codes make reference to implementation and 52% indicate that compliance with the code is monitored. Béthoux et al. (2007) find that implementation is an important topic in codes, occupying 10.11% of their content. In our results, implementation mechanisms account for an average of 17.52% of the total extension of the codes and it is the third most important content overall (see Figure 1).

5 Discussion and conclusion

After the Enron scandal it seemed for a time that values had come back into fashion. However, certain business conducts that were at the heart of the present financial crisis still suggest a flagrant disregard for ethics and corporate social responsibility. Nevertheless, *Fortune's* annual ranking of the world's most admired companies remains quite steady. The admiration of these companies is grounded mainly in values; and so corporate values are expected to be outlined in institutional documents, especially in codes of ethics.

From this perspective, the goal of this article has been to review the content of the codes of these admired companies to find out if they exhibit a deliberate sensibility for corporate social responsibility and for the external stakeholders, considered by Stohl et al. (2009) to be characteristic of the most evolved codes of ethics, those defined as "3G codes", codes of the third generation. Therefore, our research question was, "Do the most admired companies of the world have codes settled on social, global and environmental aspects of corporate responsibility, paying attention to external stakeholders beyond just shareholders and internal stakeholders"?

After reviewing each of these codes and following the methodology described above, the answer to this research question is in the negative.

In contrast to what might be expected, the world's most reputable corporations still place a strong emphasis on aspects related to the so-called "first ethical

generation of codes". Our analysis shows that about 20% of the content is devoted to regulation and compliance issues. Together with this proportion, almost 18% of the extension of the codes is about implementation and channels of communication, formation and accountability. Effective implementation is a guarantee of the quality and success of codes, helping to build credibility and inspiring confidence, and, therefore contributing largely to its efficiency. Nevertheless, it is also a symptom of the growing role of codes as management tools. These percentages are smaller in the samples of literature from the 1980s and 1990s. Therefore, it seems to be a fairly recent development.

Kaptein and Schwartz (2008) and Bétoux et al. (2007) remind us that codes of ethics are more and more oriented to favor the best control of the organization. For this reason, they consider the normative and control aspects as the most important ones. The mentioned instrumental functionality is quite coherent with the ample treatment given to regulatory areas and legal compliance, and it reinforces the link with the first ethical generation of codes.

The components of the "second generation" also enjoy heavy representation. Although the majority of the direct stakeholders do not capture much detailed attention, the employees quite notably do receive such dedication. If this treatment is added to the internal organizational rules (almost entirely devoted to the employees), it becomes evident that this group is clearly the priority focus in the studied codes (40.31%).

The content devoted to the employees refers more to internal rules of behavior (32.84%) than to safeguards of their rights and welfare (7.47%). Once again, it strengthens the use of the codes as tools to reaffirm the control and the hierarchy of the firm, as well as to produce a mechanism of self-protection against the workers.³⁵ These results, along with the percentage of text dedicated to legal compliance, lead us to an unexpected conclusion: these codes have a markedly normative and regulatory orientation, closely associated with the first generation rather than with the second. This orientation is focused, albeit implicitly, on achieving the optimal economic output, which is associated with "first generation" codes.

With regard to aspects related to global, social and environmental responsibilities, the findings do not allow us to infer a significant evolution towards a greater concern for the growing social demand. Corporate codes of ethics are not concerned with ethical values and principles of corporate culture (6.71%), nor with social and environmental issues (4.16%), showing a definite lack of interest (see Figure 1). Therefore they do not come close to the ethics contemplated in the "third generation of codes".

³⁵ Stevens 1994; Bétoux et al. 2007.

Although it would be interesting to ascertain to what degree regional and sectoral tendencies influence these trends, the size and level of concentration on US corporations of the chosen sample do not allow for making generalizations from the conclusions relating to these aspects. Yet we can speculate, albeit timidly, on the differences resulting from the regional or national origins of the companies. In particular, Asian corporations pay greater attention to matters concerning social and environmental aspects in comparison to American and European, whilst those concerning implementation are notably less important. In fact, questions associated with corporate relations to society reach an average of 9.58% of the extension of the codes (in contrast with 1.43% for American companies and 1.95% for European corporations); this is also the third most important content overall for Asian firms. Analogously, concern for the environment captures an average of 7.77% of the extension of the codes (in contrast with 1.10% for American companies and 4.59% for European corporations), and it constitutes the fifth most important content overall for Asian corporations. It is also remarkable how little importance Asian firms devote to implementation mechanisms, which only account for 4.24% of the extension of the codes (in contrast to 18.63% for American companies and 20.21% for European firms; see Figure 3). These aspects could be related to the different social pressures perceived by each business according to its origin and manner of facing globalization.

When it comes to drawing industry-based conclusions, it is again important to acknowledge that due to the small dimension of our sample, none of the industries involved had a significant volume of companies. Despite these drawbacks, it is interesting to point out the fact that financial consulting and insurance companies seem to be relatively less concerned for the impact they have on the community than other companies. For financial, consulting, and insurance companies, community accounts for only 1.94% of the extension of their codes (see Figure 2).

All things considered, the codes of the 50 (46) most admired companies of the world seem to be closer to “codes of conduct” rather than to “codes of ethics” or “codes of CSR”. Normative and control orientation dominates, attempts to encourage reflection and ethical growth in the organization are weak, and concern for social responsibility is very low. These codes of ethics resemble “first generation” codes rather than “second”. In this sense, contrary to its public acceptance, the philosophy of corporate social responsibility is scarcely present in the codes of the most reputable companies, which are still governed by traditional rules related to immediate economic success, normative compliance, and internal management.

A rigorous search for empirical evidence in this matter would certainly be of interest, requiring a continuous examination over time of the evolutionary process of codes according to the “longitudinal” method of Kaptein and Schwartz (2008). It cannot be forgotten that an essential dimension of a code’s quality in

terms of ethics and social responsibility (its evolution to the “third generation”) lies in the form in which it is created and implemented, in its transparency and credibility, in the degree of stakeholders’ participation (the more intense and extensive, the greater the company’s commitment to the CSR) and in the subsequent consensus in its acceptance. Comprehending these different aspects of corporate codes entails technical procedures very different from the content analysis we have employed, but does not lessen the importance of this analysis. The content of the code is always a reflection of what companies hold desirable and, therefore, it constitutes an irreplaceable element to evaluate its quality and effectiveness. This defines the moral compass that must be used to measure reality.
