

BELL

TWO IMPORTANT NEW BOOKS

SCHOOL MATHEMATICS

A Unified Course

by H. E. PARR, M.A., *Chief Mathematics Master, Whitgift School.*

Part I, now ready, 7s. 6d. ; or with answers, 8s.

Part II ready early 1950. Part III in active preparation.

A completely fresh unified course of mathematics based on the syllabus recommended by the Jeffery Report in 1944 and now largely adopted by all the examining bodies. Every endeavour has been made throughout to treat mathematics as a single subject, and the material has been carefully designed to be within the capabilities of the average pupil. The full course will cover the ground from the age of 11 plus to the standard of the present School Certificate. Part I deals with the first two years' work, it presupposes a knowledge of the ordinary processes of arithmetic, weights and measures, money sums and long multiplication and division of whole numbers. Part II will cover the third and fourth years. Part III will complete the course.

MECHANICS

by P. GANT, B.Sc., *Mathematical Master, Felsted School.*

Part I Kinematics and Part II Dynamics issued together, 5s. Part III, Statics, 3s. 6d.

Part IV, Further Statics and Dynamics, 5s. 6d. Parts I-III bound together, 7s. 6d.

This new book provides a simple and direct course in elementary mechanics. It is essentially a mathematics and not a physics text, for the emphasis is upon experience rather than upon experiment. It is modern in treatment and has a number of special features among which are: the ease with which the order of treatment can be adapted to meet individual requirements, the restriction of formulae throughout, since in the author's view pupils cannot learn mechanics by learning formulae, and the idea is more important than the rule; the use of both absolute and gravitational units. The complete course is intended to cover Higher Certificate needs, while Parts I-III will be found more than adequate for Additional Mathematics at the School Certificate stage.

G. BELL & SONS, LTD., PORTUGAL ST., LONDON, W.C.2

A First Course in Mathematical Statistics

C. E. WEATHERBURN

An explanation of the principles underlying the theory of mathematical statistics, and an attempt to prove the formulae and the validity of the methods commonly used by statisticians.

SECOND EDITION

15s. net

Geometry of Time and Space

ALFRED A. ROBB

Copies of the SECOND EDITION (1936) of this important pioneer work are again available.

25s. net

Mathematical Statistics and Probability

Edited by **JERZY NEYMAN**

Thirty papers presented at a conference in Berkeley, California. They deal with applications of mathematical statistics and probability to philosophy, astronomy, economics, agriculture, biology, forestry, psychology and entomology.
