Background and aims: To explore rearing, coping, attributional style and their relations in depression adolescents.

Methods: 64 adolescents with depressive disorder and 125 normal subjects of similar age, sex were presented with self-made social demographic scale, Egna Minnen av Barndoms Uppfostran-own memories of parental rearing practices in childhood (EMBU), Children attributional style questionnaire (CASQ) and Coping style questionnaire.

Results:

1. As to EMBU, there was a significant deficit in parental emotional warmth ($p < 0.001$) with depression adolescents, and whose parental punishment and strict ($p < 0.05$), rejection and denial ($p < 0.001$) were higher than normal ones.
2. As to CASQ, the differences were significant in self-blame ($p < 0.001$), asking for help ($p < 0.001$), daydreaming ($p < 0.001$) and recession ($p < 0.05$).
3. The difference of attributional pattern was significant ($p < 0.001$).
4. Mather' emotional warmth and rejection and denial were both related to adolescents' coping style and attributional style.

Conclusion: Depressive adolescents had negative coping style and attributional style, and mother' rearing style may has relation with them.
