**Introduction:** There is growing concern about the influence of the pharmaceutical industry on psychiatric teaching and psychiatric professionalism as a whole. As a consequence, several national and international medical and psychiatric associations have issued guidelines to regulate the interactions between physicians and industry.

**Objectives:** The EFPT-PRIRS study aims to provide the lacking data on the extent and nature of these interactions among psychiatric trainees across Europe.

**Methods:** Study objectives were determined by the EFPT research group (EFPT-RG), after discussion with national and international experts. A survey was then devised compiling previously published questionnaires extending them by questions with specific relevance to psychiatric trainees. The resulting questionnaire was piloted amongst members of the EFPT-RG, modified accordingly and subsequently distributed to the national study coordinators. All 24 EFPT member countries were invited to participate in the study and data collection is currently ongoing.

**Preliminary results:** Preliminary analysis reveals the vast differences in industry - trainee relationships across European countries as well as major differences in personal attitudes towards these interactions.

EFPT-PRIRS will potentially have an impact on the regulation of the interactions between the pharmaceutical industry and psychiatric trainees.
