

IN R&D, THE FUTURE BELONGS TO THE FLEXIBLE

Please visit Booth No. 910 at the MRS Show in Boston, November 28-30, 1989.

▲ A typical UHV internal arrangement for co-sputtering.

▼ Model 6000 modular UHV deposition system.

For as much as superconductivity is changing the future, there will also be changes in the projects you're working on.

That means the equipment you buy today should be designed to help you — not limit you — in the future.

If you decide on UHV's modular approach to deposition and sample processing, you can stay flexible enough to handle changes as they occur in superconducting, semiconducting, optical, diamond or any other rapidly developing area of materials research and development.

A UHV system begins with the basics, a standardized ultra-clean, ultra-low pressure 5×10^{-11} Torr vacuum chamber (two sizes), pumps, vacuum gauges, gas controls, electrical distribution system, and a versatile sample manipulation stage.

To this, you can add (now or later) any one of dozens of options, including RF-DC sputtering, evaporation, MBE, ECR, ion sputtering or others, to create a unique R&D tool.

Write or call for UHV's complete 1989 catalog and price list. Let UHV help you stay flexible for the future, at an affordable price.

BUILDING EQUIPMENT FOR THE WORLD'S LEADING SCIENTISTS AND ENGINEERS.

The DARC*

An enlightening experience

***Digital Automated Rocking Curve Topography System**

A fully automated x-ray analysis system capable of determining:

- **simultaneous** substrate and epitaxial uniformity
- lattice **misfit** measurements to 0.01% strain
- near **real-time** defect mapping
- ideally suited for laser diode, LED, and detector material analysis
- multi-layer epitaxial film analysis NO PROBLEM
