"We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions."—*British Medical Journal*, May 3, 1890.

LISTERINE

*A safe, non-poisonous, unirritating
antiseptic solution*

LISTERINE is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle, or douche, in catarrhal conditions of the nose and throat.

LISTERINE in proper dilution may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

LISTERINE embodies a two-fold antiseptic effect, in that after the evaporation of its volatile constituents—thyme, eucalyptus, mentha, gaultheria, and ethyl alcohol—a film of boracic and benzoic acids remains upon the surface to which Listerine has been applied, affording more prolonged antiseptic protection.

LISTERINE is a trustworthy surgical dressing; it has no injurious effect upon the tissues in which the healing process is going on.

LISTERINE in teaspoonful doses will often afford relief in fermentative dyspepsia, and is largely prescribed, with excellent results, in the various forms of diarrhœa occurring in infants and adults.

LISTERINE literature, including special pamphlets upon *Respiratory Diseases*, may be had, by physicians, upon application to

ANTI-CATARRH VACCINE (Prophylactic).

Prepared in the Vaccine Laboratory of St. Mary's Hospital, London (Founder—Sir A. E. Wright, M.D., etc.), and supplied to the Medical Profession through the agency of **PARKE, DAVIS & CO.**

This vaccine is adapted for the preventive inoculation of individuals who suffer from recurring "colds," in cases in which a bacteriological investigation is not convenient, and in cases where there is some general diminution in resistance, indicated by the patient becoming infected by any one of the several microbes which may cause these catarrhs. It is not intended to replace an autogenous vaccine in the case of patients who are subject to the periodic lighting up of a chronic infection by some one microbe.

Each c.c. of the vaccine contains :—

<i>Micrococcus catarrhalis</i> ...	100 millions.	<i>Staphylococcus</i> ...	500 millions.
<i>S. pneumoniae</i> (Friedländer) ...	100 millions.	<i>Bacillus septuus</i> (diphtheroid) ...	50 millions.
<i>Pneumococcus</i> ...	50 millions.	<i>Bacillus influenzae</i> ...	300 millions.
	Parodontal Streptococcus	12 millions.	

Dose.—0.5 c.c. for the initial dose ; 1 c.c. to be given fourteen days after the first dose, and subsequently at monthly intervals during the winter. This vaccine may produce a marked local reaction if injected into muscular tissue ; it should be administered subcutaneously.

The vaccine is supplied in bulbs of about 1 c.c., also in bottles of 10 and 25 c.c.

Particulars of other vaccines (including a MIXED VACCINE FOR TREATMENT OF COLDS) issued by the St. Mary's Hospital Vaccine Laboratory will be sent to any Medical Man, on request, by the Sole Agents—

THIS year's volume aims, like its predecessors, to be a faithful reflex of current Medical and Surgical thought. It is, therefore, of necessity coloured by the consideration of the many new problems which are thrust upon us by the War. These problems will confront the general Practitioner on every hand, and he must be prepared to deal with them.

Hence the current volume has a unique value, in that it furnishes the reader with a careful review of the latest achievements in War Surgery and Medicine, which will be of value now and in the years to come, and which cannot be obtained from any other source.

The civil side of the Practitioner's work has, of course, not been neglected.

The new "Annual" continues to be, as in the past, a digest of the best modern teaching culled by experts from the medical literature of the world.
