

Methods: In Phase 1, literature and publications from different countries were studied in order to outline existing guidelines. In Phase 2, the guidelines used for music events in Sweden were used by EMS planning officers during a number of events. The officers also were given a number of simulation cases to validate the correctness of their estimations.

Results: The guidelines used at music events also could be used easily and safely for planning for available healthcare resources at sporting events. The estimated resources matched those anticipated by experienced planning officers (100%).

Conclusions: There were no common guidelines for planning for healthcare resources at sporting events. The recently implemented national Swedish guidelines for planning healthcare resources at music events can be used at sporting events in Sweden.

(P81) Role of a Mobile Intensive Care Unit in the Emergency Medical System of the 2008 G8 Summit in Japan

Takayuki Irahara,¹ Hisayoshi Kondo,² Seizan Tanabe,² Akira Fuse,² Shigeki Kushimoto,² Hiroyuki Yokota²

1. Japan Surgical Society, Japanese Association for Acute Medicine, Tokyo, Japan
2. Department of Emergency and Critical Care Medicine, Nippon Medical School, Tokyo, Japan

Introduction: The G8 Hokkaido Toyako Summit 2008 was held in Japan from 07–09 July at The Windsor Hotel TOYA. The Ministry of Health, Labour and Welfare (MHLW) of Japan established an emergency medical system for this special mass gathering.

Methods: The MHLW set up the medical headquarters near the hotel, and distributed many medical assistance teams (including doctors, nurses, and logisticians) and equipment to medical relief posts in the area. Four teams, including surgeons from Nippon Medical School, rotated for standby duty at a Mobile Intensive Care Unit (MICU) located next to the hotel. This special vehicle is supplied with medical equipment for disaster rescue, and is owned by the Japanese Red Cross Kumamoto Hospital. The task was to perform emergency operations in case of severe injury to VIPs. Surgical equipment was supplied from surrounding hospitals.

Results: Fortunately, no serious events occurred except for the case of emergent transportation by helicopter for a patient with an acute abdomen. But, the importance of deploying the MICU in this kind of event was realized.

Conclusions: In an emergency medical system for mass-gatherings, appropriate distribution of medical resources using local facilities, and construction of patient transportation system, etc., is important. A MICU seems to be effective in such situation because of having advanced medical equipment and mobility.

(P82) Public Health Services “Getting a Seat at the Emergency Planning Table”

Jan Fizzel, Paul K. Armstrong, Kerry Chant

New South Wales Department of Health, North Sydney, New South Wales Australia

Introduction: Sydney, Australia hosts many mass gatherings. Some receive special government attention—due either to the status of invitees (e.g., world leaders attending the APEC Leaders’ Week 2007 (APEC 2007)) or the scale and length of the event (e.g., World Youth Day 2008 (WYD’08), with 400,000 attendees). New South Wales (NSW) public health services were involved in planning for, and responding to, public health concerns during these gatherings. To assist other public health planners, ways in which this involvement has enhanced the profile of public health services in emergency planning and response and improved public health emergency readiness were examined. **Methods:** The experience gained from the involvement of the NSW public health services in preparing for and responding to APEC 2007 and WYD’08 will be described. **Results:** During APEC 2007, public health officials worked with event organizers and emergency organizations on whole-of-government planning groups, especially for the health effects of chemical, radiological, or bioterrorism incidents. The event enabled NSW Health to test new information management systems and on-site surveillance of participant presentations to event-specific medical clinics.

During planning for WYD’08, public health services assisted with safe food choices, guidelines for mass accommodation and sanitation, and promotion of a safe, healthy event. Public health systems built for APEC 2007 were refined and expanded, increasing response capacity for other emergencies or mass gatherings.

Conclusions: Public health involvement in planning for mass gatherings facilitates the development of systems for use in other emergencies. Participation in multi-agency planning for APEC 2007 and WYD’08 provided openings for relationships and vocalizing public health concerns. Increasing the profile of public health participation has helped “gain a seat” at the emergency-planning table.

(P83) Lessons Learned during a Mass Gathering of 10,000 Indigenous People

Sandra I. Castelblanco Betancourt,¹ Ayan Sen²

1. District Health Secretariat, Risk Management Office, Bogotá, Bogotá, Colombia
2. Department of Emergency Medicine, Henry Ford Hospital, Detroit, Michigan USA

Background: Migration, whether permanent or temporary, always has been a traditional response or survival strategy of people confronting the prospect, impact, or aftermath of disasters. After a long march through different regions of southwest Colombia, 10,000 representatives of Colombia’s indigenous peoples arrived in Bogotá protesting governmental failure to honor past agreements regarding the distribution of land for their communities and the lack of respect of human rights. The gathering was declared a

social emergency, and the District Health Secretariat delegated an emergency response team to meet the needs of the community in terms of medical assistance during their weeklong stay in a university campus in the capital. Although the inter-disciplinary team had experience in mass-gathering situations, they were confronted with a wide variety of aboriginal health traditions and beliefs and had to find a balance in order to effectively intervene without the resistance of the indigenous community. An investigation on what lessons are to be learned by health professionals who provide assistance to indigenous communities in urban settings was attempted.

Methods: A questionnaire-based survey is being conducted among members of the team who were assigned to assist the indigenous group. Experience, training in relation to aboriginal health and mass migration issues, and ethical and legal concerns are being sought. A five-point Likert Scale was used for responses.

Results: The results will be presented at the Congress.

Conclusions: Health professionals routinely are trained to respond to civilians, but there is a need to understand the differences when it comes to assisting indigenous communities.

(P84) Schoolies Festival—What Do Young People Do to Stay Safe and Healthy at Crowded Events?

Alison Hutton; Allison Roderick; Rebecca Munt; Paul Arbon
Flinders University, Adelaide, South Australia Australia

Introduction: Schoolies Festivals are events that give young people the opportunity to celebrate the end of their school life. These festivals provide a “safe zone” in a designated alcohol-free area for dance and live music. Festivals such as the Adelaide Schoolies Festival (ASF) are a common phenomenon in today’s society and provide the opportunity to investigate the health protective behaviors of young people who attend mass gatherings. This pilot study provides baseline data about young people’s health and safety concerns and improves our preparedness at mass gatherings.

Methods: Young people attending the ASF were surveyed. Surveys gathered baseline data on demographics and rated attitudes and behaviors. Surveys were distributed by hand and collected by the researchers during the festival.

Results: A total of 300 surveys were distributed and 220 were returned (73%) in a population of 5,000 (3.3%). Behaviors important to staying safe were: not using drugs, staying hydrated, and drinking alcohol responsibly. When asked “What is risky?”, participants rated violent behavior and exposure to drugs as their main concerns. The mean age of participants was 17.7 years.

Conclusions: Data on young people attending mass gatherings are limited. This pilot is developing ways of assessing opinions of young people attending mass gatherings. This presentation will identify deficits in data collection techniques used and highlight some emerging themes from the data. By improving understanding of young people’s health and safety while attending mass gatherings, preparedness can be improved.

Oral Presentations—Emergency Medical Services

Developing Disaster Medical Assistance Teams in Australia—From Kandalhadoo to Karratha

Andrew Robertson; Muriel Leclercq

Western Australian Department of Health, East Perth, Western Australia Australia

Western Australia (WA) was one of the first states in Australia to deploy medical team members to work in the stricken regions of the Maldives and Banda Aceh following the 2004 tsunami. Historically, Australia has relied on the Australian Defence Force to provide overseas medical assistance. However, in this instance, the volunteers deployed were civilian staff predominantly from tertiary hospital environments. While the deployment of civilian-based medical teams has been questioned (mainly because of the lack of pre-deployment arrangements), Australia’s civilian medical response to the Tsunami proved to be appropriate and effective.

This early experience of civilian disaster medical assistance teams led the WA Department of Health to pilot these teams and develop a national model for their future development, which would then be implemented by other Australian States and Territories. This pilot has been completed and implemented in WA, with further lessons learned after the deployment of a WA medical team to Yogyakarta following the 2006 Java earthquake and to Karratha after Cyclone George in 2007.

This presentation will examine the current status of the implementation of the Australian Medical Assistance Team’s (AUSMAT) model in Australia, recent team deployments, and the challenges faced in delivering medical care—particularly deploying medical teams and evacuating casualties in states like WA, which have major high-risk industries located in areas that are thousands of kilometers from a major population center with small, poorly-resourced hospitals.

By late 2009, Australia should have well prepared, equipped, and trained civilian, state-based teams that are capable of deploying to a mass-casualty incident either within Australia or internationally.

Development of an Emergency Medical Services and Trauma System in Sri Lanka: An Experiential Report

Ross E. Bryan, IV;¹ Amy Marr;¹ Donnie Woodyard;² Mohammad Daya¹

1. Oregon Health and Science University, Portland, Oregon USA

2. Medical Team International, Tigard, Oregon USA

Introduction: Trauma is a leading cause of morbidity and mortality in many developing countries. In 2005, Sri Lanka experienced a total of 550,108 hospital admissions due to trauma resulting in an incidence rate of 2,797 per 100,000 persons, and a hospitalization rate of 15%. The majority of these patients were between their second and fourth decade of life, resulting in a staggering loss of productivity. In
