THE ANATOMY OF WOODY PLANTS. By E. C. JEFFREY. x and 478 pages, cloth; 26s net.

The author is easily the leading American authority on the anatomy of plants and his book aims to describe, analyze, and discuss the anatomical structure of the most important families of plants. It does for the anatomy of plants what so many textbooks have done for the human anatomy. 306 figures and illustrations.

THE EVOLUTION OF SEX IN PLANTS. (*The University of Chicago Science Series.*) By JOHN M. COULTER. x and 140 pages, small 12mo, cloth; 7s net.

In this work the prevalence of asexual reproduction among plants is emphasized, the author showing that in many of the lower forms sexual reproduction is unknown. The more detailed parts of the discussion are illustrated by cuts and drawings introduced into the text.

INDIVIDUALITY IN ORGANISMS. (*The University of Chicago Science Series.*) By CHARLES MANNING CHILD. x and 212 pages, small 12mo, cloth; 8s 3d net.

An attempt to state, and to present evidence in support of, a conception of the nature of organic individuality which the author has developed as a result of fifteen years' investigation of the processes of reproduction and development of lower animals.

THE STORY OF THE MAIZE PLANT. (*The University of Chicago Science Series.*) By PAUL WEATHERWAX. 300 pages, small 12mo, cloth; 9s 6d net.

The only complete, modern exposition of the morphology of the maize plant. In this volume Mr Weatherwax is interested in giving a well-balanced, reliable summary of our present botanical knowledge of maize. He eliminates the influence of the economic point of view and describes maize as a plant with problems of its own to solve, a life of its own to live, and a part of its own to play in the drama of organic existence.
