

method is described for preparing snow-crystal replicas and for measuring the size and distribution of cloud particles.

GATTY, O., FLEMING, W. L. S., and EDMONDS, J. M. Some Types of Polygonal Surface Markings in Spitsbergen. *Am. Journ. Sci.*, Vol. 240, 1942, pp. 81-92.

A number of measurements of surface polygons in Spitsbergen is recorded and analysed statistically and several new features of polygonal systems are described. A tentative hypothesis of origin of these polygons is put forward to account for the new features. It is not very different from older hypotheses, but throws increased emphasis on the importance of solifluction and vegetation. It is pointed out that deformation of the surface in general occurs when part of the surface is rigid and part of it plastic, and this is the special significance of the freezing point in producing polygonal markings.

OPPENHEIM, VICTOR. Glaciaciones en el Peru. *Revista de la Academia Colombiana de Ciencias Exactas, Fisico-Químicas y Naturales*, Vol. 6, Nos. 22 and 23, 1945, pp. 319-21, illustrations.

Observations made in various high ranges of Peru indicate that there are evident remains of three to four glaciations in the Andes of Peru. These vary from levels of 2800 m. which is the lowest, to 4800 m. In this manner the ice from the Pleistocene epoch to the present has retreated approximately 2000 m.

The lowest level of an actual glacier observed, Tullpa Raju, in the Cordillera Blanca, is 4300 m. Remains of human buildings prove that more than 500 years ago man inhabited the same region at higher altitudes, which indicates the unequal and sporadic movement of the ice, depending not only on climatic conditions but also on certain factors yet little known to modern geology and climatology.

ROGSTAD, OLAF. Jostedalsbreens Tilbakegang. *Norsk Geografisk Tidsskrift*, Bind 8, Hefte 8, 1941, pp. 273-93.

In this paper an attempt has been made to determine the decrease of the glacier volume of Jostedalsbreen during the last forty years, as based on a comparison of the hydrographic researches in some watercourses and the published measurements of the length of glacier tongues. There is an English summary of three pages.

ROGSTAD, OLAF. Väre Breers Tilbakegang. *Norsk Geografisk Tidsskrift*, Bind 9, Hefte 4, 1942, pp. 129-57.

This paper sets out to determine the decrease of the glacier volume of Svartisen and Folgefonna in a similar way to that for Jostedalsbreen. In this connection an investigation has been made of the effects upon the regulated water supply in Glomfjord Power Station by the decrease of Svartisen. There is an English summary of five pages.

## GLACIOLOGICAL LITERATURE

THIS bi-annual list of glaciological literature aims to cover the *scientific* aspects of snow and ice in all parts of the world. Attention is drawn to the bibliographies in each number of *The Polar Record* (Cambridge), which aim to cover the significant work dealing with expeditions, research, equipment and conditions of living in the Polar regions. Both journals, however, deal with Polar literature having specific glaciological interest and with general matters of a practical nature such as snowcraft.

A few copies of some of the works marked with an asterisk in Vol. 1, No. 1, 1947, are still available for distribution.
