

## NEW INSTRUMENTS. PREPARATIONS, ETC.

A NEW FORM OF TRACHEAL VALVE. Philip de Santi. ("Lancet," July 25, 1896.)

This instrument is designed for those patients who have to wear a tracheotomy tube for several months, or even permanently. The objections to the usual form are, that when the patient attempts to talk he has to place his finger on the mouth of the tube, and on coughing the expectoration is voided in an uncleanly and unpleasant manner through the tube. There are several objections to the "pea valve," which was designed to overcome these objections. The movements of

the "pea" are noisy, the ball readily gets clogged, and it often gets out of order. These objections have not been overcome by the adoption of an india-rubber valve arrangement. In the author's invention a silver valve working on a hinge permits the free entrance of air on inspiration; on expiration, vocalization, or coughing, the valve is driven forwards and comes up tightly against a small silver inner rim, thus preventing any exit of air, mucus, etc. The advantages of this are:—(1) Its simplicity; (2) the facility with which it can be kept clean and sterilized; (3) the working of the valve is unaccompanied with any rattling noises; (4) the valve is airtight, and cannot be coughed out; and (5) the supply of air is but little diminished, considerably less so than in Luer's or Smith's valves. Two illustrations make the above description easily understood.

St. Clair Thomson.

QUER'S AURAL CURETTE. (Messrs. Down Bros., 21, St. Thomas' Street, Borough.)

A specimen of this elegant little instrument has been submitted to us for inspection, which looks as if it would prove of great service in those troublesome

cases in which foreign bodies are found in the external auditory canal. When the foreign body is *near* the membrane, however, this instrument should not be used, as the lower or curette blade projects  $\frac{5}{8}$  inches beyond the upper. The instrument in the cut is shown with the curette in the straight position for introduction and the erect for retraction.

**NEW LARYNGEAL, NOSE, and PHARYNGEAL SPRAYS.** (Chas. Midgley, Limited, 23, St. Anne's Square, Manchester. 3s. 6d. each net. Agent: Rogers, Oxford Street, London.)

These are most ingenious sprays, and are made in the three forms as shown in the woodcuts, and are the invention of Dr. A. Hodgkinson, of Manchester. They were originally made of glass, but this proved too brittle, and so they are

now made of vulcanite. The fluid to be used is dropped into the cup, and by this means an absolutely accurate and known amount of the solution (even as small a dose as two minims) is used. This is, of course, a great advantage when cocaine is used by the patient, or where, in kakosmia and allied conditions, other toxic remedies, as strychnia, are employed.

The small cost of these instruments will commend them especially to hospital surgeons, who often desire to order them for hospital patients.

# INDEX TO VOL. XI., 1896.
