Dedicated to the memory of Professor Gordon B. Preston

#### Abstract

We calculate the rank and idempotent rank of the semigroup $\mathcal{E}(X, \mathcal{P})$ generated by the idempotents of the semigroup $\mathcal{T}(X, \mathcal{P})$ which consists of all transformations of the finite set $X$ preserving a nonuniform partition $\mathcal{P}$. We also classify and enumerate the idempotent generating sets of minimal possible size. This extends results of the first two authors in the uniform case.

2010 Mathematics subject classification: primary 20M20; secondary 20M17.
Keywords and phrases: transformation semigroups, idempotents, generators, rank, idempotent rank.

## 1. Introduction

Let $S$ be a monoid with identity 1 and $E(S)=\left\{s \in S: s^{2}=s\right\}$, the set of all idempotents of $S$. For a subset $U \subseteq S$, we write $\langle U\rangle$ for the submonoid of $S$ generated by $U$, which consists of all products $u_{1} \cdots u_{k}$ with $u_{1}, \ldots, u_{k} \in U \cup\{1\}$. The rank of $S$, denoted $\operatorname{rank}(S)$, is the minimal cardinality of a subset $U \subseteq S$ such that $S=\langle U\rangle$. If $S$ is idempotent generated, then the idempotent rank of $S$, denoted idrank $(S)$, is the minimal cardinality of a subset $U \subseteq E(S)$ such that $S=\langle U\rangle$.

The full transformation semigroup on a set $X$, denoted $\mathcal{T}_{X}$, is the set of all transformations of $X$ (that is, all functions $X \rightarrow X$ ) with the semigroup operation of composition. Let $\mathcal{P}=\left\{C_{i}: i \in I\right\}$ be a partition of $X$; that is, the sets $C_{i}$ are nonempty and pairwise disjoint and their union is all of $X$. The set

$$
\mathcal{T}(X, \mathcal{P})=\left\{f \in \mathcal{T}_{X}:(\forall i \in I)(\exists j \in I) C_{i} f \subseteq C_{j}\right\}
$$

consisting of all transformations of $X$ preserving $\mathcal{P}$, is a subsemigroup of $\mathcal{T}_{X}$. A calculation of $\operatorname{rank}(\mathcal{T}(X, \mathcal{P}))$ for finite $X$ is given in [2] and [1] for the uniform and

[^0]nonuniform cases, respectively. (Recall that $\mathcal{P}$ is uniform if $\left|C_{i}\right|=\left|C_{j}\right|$ for all $i, j \in I$.) We write $\mathcal{E}(X, \mathcal{P})=\langle E(\mathcal{T}(X, \mathcal{P}))\rangle$ for the idempotent generated subsemigroup of $\mathcal{T}(X, \mathcal{P})$. In [3], the first two authors calculated $\operatorname{rank}(\mathcal{E}(X, \mathcal{P}))$ and $\operatorname{idrank}(\mathcal{E}(X, \mathcal{P}))$ in the case where $X$ is finite and $\mathcal{P}$ uniform; among other things, it was shown that the rank and idempotent rank are equal, and the idempotent generating sets of this minimal possible size were also classified and enumerated. The purpose of the current work is to extend these results to the nonuniform case. Our main results include the classification and enumeration of the idempotents of $\mathcal{T}(X, \mathcal{P})$ (Propositions 3.1 and 3.2), the calculation of the rank and idempotent rank of $\mathcal{E}(X, \mathscr{P})$ (Theorem 3.16) and the classification and enumeration of all idempotent generating sets of the minimal possible size (Proposition 3.15 and Theorem 3.17). In particular, the rank and idempotent rank are equal unless $\mathcal{P}$ has exactly two blocks of size 1 (and at least one other block).

## 2. Preliminaries

In this section, we state a number of results we will need concerning $\mathcal{T}_{X}$ and $\mathcal{T}(X, \mathcal{P})$ for uniform $\mathcal{P}$. For the remainder of the article, we fix a finite set $X$. The group of units of $\mathcal{T}_{X}$ is the symmetric group $\mathcal{S}_{X}$, which consists of all permutations of $X$ (that is, all bijections $X \rightarrow X$ ). Denote by $\mathcal{E}_{X}=\left\langle E\left(\mathcal{T}_{X}\right)\right\rangle$ the idempotent generated subsemigroup of $\mathcal{T}_{X}$. We generally denote the identity element of any monoid by 1 ; in particular, $1 \in \mathcal{T}_{X}$ denotes the identity map on $X$, which we also sometimes write as $\mathrm{id}_{X}$. If $x, y \in X$ and $x \neq y$, then we write $e_{x y} \in \mathcal{T}_{X}$ for the transformation defined by

$$
z e_{x y}= \begin{cases}x & \text { if } z=y \\ z & \text { if } z \in X \backslash\{y\}\end{cases}
$$

It is clear that $e_{x y} \in E\left(\mathcal{T}_{X}\right)$ for all $x, y$. We write $\mathcal{D}_{X}=\left\{e_{x y}: x, y \in X, x \neq y\right\}$. The next result collects several facts from [4-6]. We always interpret a binomial coefficient $\binom{m}{n}$ to be 0 if $m<n$.

Theorem 2.1. Let $X$ be a finite set with $|X|=n \geq 0$. Then

$$
\mathcal{E}_{X}=\left\langle\mathcal{D}_{X}\right\rangle=\{1\} \cup\left(\mathcal{T}_{X} \backslash \mathcal{S}_{X}\right) .
$$

Further, $\operatorname{rank}\left(\mathcal{E}_{X}\right)=\operatorname{idrank}\left(\mathcal{E}_{X}\right)=\rho_{n}$, where $\rho_{2}=2$ and $\rho_{n}=\binom{n}{2}$ if $n \neq 2$.
The minimal idempotent generating sets of $\mathcal{E}_{X}$ were characterised in [6] in terms of strongly connected tournaments. Such tournaments were enumerated in [7], and it was shown in [3] that any idempotent generating set for $\mathcal{E}_{X}$ contains one of minimal size.

Theorem 2.2. Let $X$ be a finite set with $|X|=n \geq 0$. Then any idempotent generating set for $\mathcal{E}_{X}=\left\langle E\left(\mathcal{T}_{X}\right)\right\rangle$ contains an idempotent generating set of minimal possible size.

The number of minimal idempotent generating sets for $\mathcal{E}_{X}$ is equal to $\sigma_{n}$, where $\sigma_{2}=1$ and $\sigma_{n}=w_{n}$ for $n \neq 2$, and where the numbers $w_{n}$ satisfy the recurrence

$$
w_{0}=1, \quad w_{n}=F_{n}-\sum_{s=1}^{n-1}\binom{n}{s} w_{s} F_{n-s} \quad \text { for } n \geq 1
$$

where $F_{n}=2_{\binom{n}{2}}=2^{n(n-1) / 2}$.
The following analogues of Theorems 2.1 and 2.2 were proved in [3].
Theorem 2.3. Let $S=\mathcal{E}(X, \mathcal{P})$, where $\mathcal{P}$ is a uniform partition of the finite set $X$ into $m \geq 0$ blocks of size $n \geq 1$. Then $\operatorname{rank}(S)=\operatorname{idrank}(S)=\rho_{m n}$, where $\rho_{21}=2$ and $\rho_{m n}=m \rho_{n}+n!\binom{m}{2}$ if $(m, n) \neq(2,1)$. The numbers $\rho_{n}$ are defined in Theorem 2.1.

Theorem 2.4. Let $S=\mathcal{E}(X, \mathcal{P})$, where $\mathcal{P}$ is a uniform partition of the finite set $X$ into $m \geq 0$ blocks of size $n \geq 1$. Then any idempotent generating set of $S$ contains an idempotent generating set of minimal possible size. The number of minimal idempotent generating sets for $S$ is equal to $\sigma_{m n}$, where

$$
\sigma_{m n}= \begin{cases}1 & \text { if } m=0 \\ \sigma_{n} & \text { if } m=1, \\ \sigma_{m} & \text { if } n=1, \\ \sigma_{n}^{m} \times \sum_{k=0}^{\binom{(n)}{2}} w_{m k}\left(2^{n!}-2\right)^{k} & \text { if } m, n \geq 2\end{cases}
$$

The numbers $\sigma_{n}$ are defined in Theorem 2.2 and the numbers $w_{n k}$ satisfy the recurrence

$$
w_{00}=1, \quad w_{n k}=F_{n k}-\sum_{s=1}^{n-1}\binom{n}{s} \sum_{l=0}^{k} w_{s l} F_{n-s, k-l} \quad \text { for } n \geq 1,
$$

where $F_{n k}=\binom{\binom{n}{2}}{k} \cdot 2^{\binom{n}{2}-k}$.
Remark 2.5. It might seem odd to include the case $m=0$ (when $X=\emptyset$ ) in the previous two results, but these will be useful for stating and proving later results such as Theorems 3.16 and 3.17.

## 3. The semigroup $\mathcal{E}(X, \mathcal{P})$

For a nonnegative integer $k$, we write $[k]=\{1, \ldots, k\}$, which we interpret to be empty if $k=0$. We write $\mathcal{T}_{k}=\mathcal{T}_{[k]}$, and similarly for $\mathcal{S}_{k}, \mathcal{E}_{k}, \mathcal{D}_{k}$. Denote by $\mathcal{T}(k, l)$ the set of all functions $[k] \rightarrow[l]$, noting that $\mathcal{T}(k, k)=\mathcal{T}_{k}$. The image, rank and kernel of a function $f: A \rightarrow B$ are defined by

$$
\operatorname{im}(f)=\{a f: a \in A\}, \quad \operatorname{rank}(f)=|\operatorname{im}(f)|, \quad \operatorname{ker}(f)=\{(a, b) \in A \times A: a f=b f\}
$$

Figure 1. Diagrammatic representation of an element of $\mathcal{T}(X, \mathscr{P})$.
respectively. Obviously,

$$
\operatorname{im}(f g) \subseteq \operatorname{im}(g), \quad \operatorname{rank}(f g) \leq \min (\operatorname{rank}(f), \operatorname{rank}(g)), \quad \operatorname{ker}(f g) \supseteq \operatorname{ker}(f)
$$

for all functions $f: A \rightarrow B$ and $g: B \rightarrow C$.
Recall that $X$ is a fixed finite set. We also fix a nonuniform partition $\mathcal{P}=$ $\left\{C_{1}, \ldots, C_{m}\right\}$ of $X$. We will write $n_{i}=\left|C_{i}\right|$ for each $i$ and assume that $n_{1} \geq \cdots \geq n_{m}$. We write $n=|X|=n_{1}+\cdots+n_{m}$. For convenience, we assume that $C_{i}=\{i\} \times\left[n_{i}\right]$ for each $i \in[m]$, so $X=\left\{(i, j): i \in[m], j \in\left[n_{i}\right]\right\}$.

We now define some parameters associated to the partition $\mathcal{P}$ that will make statements of results cleaner (see especially Theorems 3.16 and 3.17). For $i \in[n]$, define the sets

$$
M_{i}=\left\{q \in[m]: n_{q}=i\right\} \quad \text { and } \quad N_{i}=\left\{j \in[i-1]: M_{j} \neq \emptyset\right\}=\left\{n_{q}: q \in[m], n_{q}<i\right\},
$$

and put $\mu_{i}=\left|M_{i}\right|$ and $v_{i}=\left|N_{i}\right|$. In particular, $\mu_{i}$ is the number of blocks of $\mathcal{P}$ of size $i$. As an example, if $n=22, m=8$ and $\left(n_{1}, \ldots, n_{8}\right)=(5,5,3,2,2,2,2,1)$, then the values of $\mu_{i}, v_{i}$ are as follows:

| $i$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mu_{i}$ | 1 | 4 | 1 | 0 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $v_{i}$ | 0 | 1 | 2 | 3 | 3 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 |

Let $f \in \mathcal{T}(X, \mathscr{P})$. There is a transformation $\bar{f} \in \mathcal{T}_{m}$ such that, for all $i \in[m], C_{i} f \subseteq$ $C_{i \bar{f}}$. Also, for each $i \in[m]$, there is a function $f_{i} \in \mathcal{T}\left(n_{i}, n_{i \bar{f}}\right)$ such that $(i, j) f=\left(i \bar{f}, j f_{i}\right)$ for all $j \in\left[n_{i}\right]$. The transformation $\underline{f} \in \mathcal{T}(X, \mathcal{P})$ is uniquely determined by $f_{1}, \ldots, f_{m}, \bar{f}$, and we will write $f=\left[f_{1}, \ldots, f_{m} ; \bar{f}\right]$. The product in $\mathcal{T}(X, \mathcal{P})$ may easily be described in terms of this notation. Indeed, if $f, g \in \mathcal{T}(X, \mathcal{P})$, then $f g=\left[f_{1} g_{1 \bar{f}}, \ldots, f_{m} g_{m \bar{f}} ; \bar{f} \bar{g}\right]$. Note that $\overline{f g}=\bar{f} \bar{g}$ and $(f g)_{i}=f_{i} g_{\overline{i f}} \in \mathcal{T}\left(n_{i}, n_{i \overline{f g}}\right)$ for all $f, g \in \mathcal{T}(X, \mathcal{P})$ and $i \in[m]$. When $\mathcal{P}$ is uniform, each $f_{i}$ belongs to $\mathcal{T}(n, n)=\mathcal{T}_{n}$ (where $n$ is the common size of each block of $\mathcal{P})$ and $\mathcal{T}(X, \mathcal{P})$ is a wreath product $\mathcal{T}_{n} \imath \mathcal{T}_{m}$, as noted in [2].

There is a useful way to picture a transformation $f=\left[f_{1}, \ldots, f_{m} ; \bar{f}\right] \in \mathcal{T}(X, \mathcal{P})$. For example, with $m=5$ and $\bar{f}=\left(\begin{array}{llll}1 & 2 & 3 & 4 \\ 2 & 2 & 4 & 5\end{array}\right) \in \mathcal{T}_{5}$, the transformation $f=\left[f_{1}, f_{2}, f_{3}, f_{4}, f_{5} ; \bar{f}\right]$ is pictured in Figure 1. (Note that these diagrams are not supposed to imply that the sets $C_{1}, \ldots, C_{m}$ have the same size.) This diagrammatic representation allows for easy visualisation of the multiplication. For example, if $f$ is as

Figure 2. Diagrammatic calculation of a product in $\mathcal{T}(X, \mathcal{P})$.
above, and if $g=\left[g_{1}, g_{2}, g_{3}, g_{4}, g_{5} ; \bar{g}\right]$, where $\bar{g}=\left(\begin{array}{lllll}1 & 2 & 3 & 4 \\ 1 & 3 & 1 & 4 & 4\end{array}\right)$, then the product $f g=$ $\left[f_{1} g_{2}, f_{2} g_{2}, f_{3} g_{4}, f_{4} g_{2}, f_{5} g_{5} ; \bar{f} \bar{g}\right]$ may be calculated as in Figure 2. Such diagrammatic methods may be used to verify various equations; an example is given in the proof of Proposition 3.3 (see Figure 4), but the rest are left to the reader.

The next result was proved in [3, Proposition 3.1] in the context of uniform partitions, but the argument works unmodified in the nonuniform case.

Proposition 3.1. A transformation $f \in \mathcal{T}(X, \mathcal{P})$ is an idempotent if and only if:
(i) $\bar{f} \in E\left(\mathcal{T}_{m}\right)$;
(ii) $f_{i} \in E\left(\mathcal{T}_{n_{i}}\right)$ for all $i \in \operatorname{im}(\bar{f})$; and
(iii) $\quad \operatorname{im}\left(f_{i}\right) \subseteq \operatorname{im}\left(f_{i \bar{f}}\right)$ for all $i \in[m] \backslash \operatorname{im}(\bar{f})$.

A formula for $|E(\mathcal{T}(X, \mathcal{P}))|$ was also given in [3, Proposition 3.1] in the uniform case. That formula seems impossible to extend to the nonuniform case, but we may give a recurrence analogous to that of [3, Proposition 3.2]. For a subset $A \subseteq[m]$, write $X_{A}=\bigcup_{a \in A} C_{a}$ and $\mathcal{P}_{A}=\left\{C_{a}: a \in A\right\}$. So $\mathcal{P}_{A}$ is a partition of $X_{A}$ (which is empty if $A$ is empty).

Proposition 3.2. Write $e(X, \mathcal{P})=|E(\mathcal{T}(X, \mathcal{P}))|$. Then

$$
e(X, \mathcal{P})= \begin{cases}1 & \text { if } X \text { is empty }, \\ \sum_{A} e\left(X_{A^{c}}, \mathcal{P}_{A^{c}}\right) \sum_{a \in A} \sum_{l=1}^{n_{a}}\binom{n_{a}}{l} l^{n_{A}-l} & \text { if } X \text { is nonempty },\end{cases}
$$

where the outer sum is over all $A \subseteq[m]$ with $1 \in A$ and we write $A^{c}=[m] \backslash A$ and $n_{A}=\left|X_{A}\right|=\sum_{a \in A} n_{a}$.

Proof. The statement for $X$ empty is clear, so suppose that $X$ is nonempty. An idempotent $f \in E(\mathcal{T}(X, \mathcal{P}))$ is uniquely determined by:
(i) the set $A=\{i \in[m]: i \bar{f}=1 \bar{f}\}$;
(ii) the element $a=1 \bar{f} \in A$ (note that $1 \bar{f} \in A$ as $\bar{f}$ is an idempotent);
(a)

(b)

Figure 3. Diagrammatic representation of (a) $e_{42 ; f}$ and (b) $g^{(2)}$ from $\mathcal{T}(X, \mathcal{P})$ with $m=5$.
(iii) the image $\operatorname{im}\left(f_{a}\right)$, say of size $l \in\left[n_{a}\right]$-there are $\binom{n_{a}}{l}$ choices for these points, each of which is mapped identically by $f_{a}$;
(iv) the images under $f$ of the elements of $\left(\bigcup_{b \in A} C_{b}\right) \backslash\left(\{a\} \times \operatorname{im}\left(f_{a}\right)\right)$, which must all be in $\{a\} \times \operatorname{im}\left(f_{a}\right)$-there are $l^{n_{A}-l}$ choices for these images; and then finally
(v) the restriction of $f$ to $X_{A^{c}}=\bigcup_{i \in A^{c}} C_{i}$-this restriction belongs to $E\left(\mathcal{T}\left(X_{A^{c}}, \mathcal{P}_{A^{c}}\right)\right)$, which has size $e\left(X_{A^{c}}, \mathcal{P}_{A^{c}}\right)$.
Multiplying these values and summing over the relevant $A, a, l$ gives the desired result.

We now move on to study the idempotent generated subsemigroup $\mathcal{E}(X, \mathcal{P})=$ $\langle E(\mathcal{T}(X, \mathcal{P}))\rangle$ of $\mathcal{T}(X, \mathcal{P})$. For simplicity, we will write $E=E(\mathcal{T}(X, \mathcal{P}))$ and $S=$ $\mathcal{E}(X, \mathcal{P})=\langle E\rangle$.

As in Section 2, for $k \geq 2$ and $i, j \in[k]$ with $i \neq j$, we write $e_{i j} \in \mathcal{T}_{k}$ for the idempotent transformation defined by

$$
l e_{i j}= \begin{cases}i & \text { if } l=j \\ l & \text { if } l \in[k] \backslash\{j\} .\end{cases}
$$

Note that $k$ (the size of the set on which $e_{i j}$ acts) depends on the context. For nonnegative integers $k, l$, we write $\operatorname{Inj}(k, l)$ (respectively, $\operatorname{Surj}(k, l)$ ) for the set of all injective (respectively, surjective) functions $[k] \rightarrow[l]$. Note that $\operatorname{Inj}(k, k)=\operatorname{Surj}(k, k)=$ $\mathcal{S}_{k}$, while, if $k \neq l$, then (exactly) one of $\operatorname{Inj}(k, l)$ or $\operatorname{Surj}(k, l)$ is empty.

In what follows, certain special idempotents from $E$ will play a crucial role. For $i, j \in[m]$ with $i \neq j$ and for any $f \in \operatorname{Inj}\left(n_{j}, n_{i}\right)$ or $\operatorname{Surj}\left(n_{j}, n_{i}\right)$, as appropriate, we write

$$
e_{i j ; f}=\left[1, \ldots, 1, f, 1, \ldots, 1 ; e_{i j}\right]
$$

where $f$ is in the $j$ th position. Note that here $e_{i j}=\overline{e_{i j ; f}}$ refers to the idempotent $e_{i j} \in$ $\mathcal{T}_{m}$. The transformations $e_{i j, f}$ trivially satisfy conditions (i)-(iii) of Proposition 3.1, so $e_{i j ; f} \in E$. If $k \in[m]$ and $g \in \mathcal{T}_{n_{k}}$, we will write $g^{(k)}=[1, \ldots, 1, g, 1, \ldots, 1 ; 1]$, where $g$ is in the $k$ th position. For example, with $m=5$, the transformations $e_{42 ; f}$ and $g^{(2)}$ are pictured in Figure 3. For any $k \in[m]$, and for any subset $U \subseteq \mathcal{T}_{n_{k}}$, we write $U^{(k)}=$ $\left\{g^{(k)}: g \in U\right\}$. If $U$ is a subsemigroup of $\mathcal{T}_{n_{k}}$, then $U^{(k)}$ is a subsemigroup of $\mathcal{T}(X, \mathcal{P})$ and is isomorphic to $U$. Note that the $k$ th coordinate of $e_{i j}^{(k)}=\left[1, \ldots, 1, e_{i j}, 1, \ldots, 1 ; 1\right]$ is $e_{i j} \in \mathcal{T}_{n_{k}}$.

Proposition 3.3. The semigroup $S=\mathcal{E}(X, \mathcal{P})$ is generated by $G_{1} \cup G_{2}$, where

$$
\begin{aligned}
& G_{1}=\left\{e_{i j}^{(k)}: k \in[m], i, j \in\left[n_{k}\right], i \neq j\right\} \quad \text { and } \\
& G_{2}=\left\{e_{i j, f}: i, j \in[m], i \neq j, f \in \operatorname{Inj}\left(n_{j}, n_{i}\right) \cup \operatorname{Surj}\left(n_{j}, n_{i}\right)\right\} .
\end{aligned}
$$

Proof. Since the elements of $G_{1} \cup G_{2}$ are idempotents, it suffices to show that $E \subseteq$ $\left\langle G_{1} \cup G_{2}\right\rangle$. Let $f \in E$. Write $A_{1}, \ldots, A_{r}$ for the $\operatorname{ker}(\bar{f})$-classes of $[m]$. Since $f$ is an idempotent, we have $f=f_{1} \cdots f_{r}$, where, for each $s \in[r], f_{s} \in \mathcal{T}(X, \mathcal{P})$ is defined by

$$
x f_{s}= \begin{cases}x f & \text { if } x \in X_{A_{s}}=\bigcup_{a \in A_{s}} C_{a}, \\ x & \text { if } x \in X \backslash X_{A_{s}} .\end{cases}
$$

So it suffices to show that $f_{1}, \ldots, f_{r} \in\left\langle G_{1} \cup G_{2}\right\rangle$. Let $s \in[r]$, and write $A=A_{s}=$ $\left\{a_{1}, \ldots, a_{k}\right\}$. For simplicity, write $g=f_{s}=\left[g_{1}, \ldots, g_{m} ; \bar{g}\right]$. Without loss of generality, suppose that $A \bar{g}=a_{k}$. By Proposition 3.1 and Theorem 2.1, we have $g_{a_{k}} \in E\left(\mathcal{T}_{n_{a_{k}}}\right) \subseteq$ $\left\langle\mathcal{D}_{n_{a_{k}}}\right\rangle$ and it quickly follows that $g_{a_{k}}^{\left(a_{k}\right)} \in\left\langle G_{1}\right\rangle$. In particular, if $k=|A|=1$, then $g=g_{a_{k}}^{\left(a_{k}\right)} \in\left\langle G_{1}\right\rangle$. So suppose that $k \geq 2$. Now fix some $1 \leq j<k$. Let $e_{j} \in E\left(\mathcal{T}_{n_{a_{j}}}\right)$ be such that $\operatorname{ker}\left(e_{j}\right)=\operatorname{ker}\left(g_{a_{j}}\right)$ and let $h_{j} \in \operatorname{Inj}\left(n_{a_{j}}, n_{a_{k}}\right) \cup \operatorname{Surj}\left(n_{a_{j}}, n_{a_{k}}\right)$ be any injective or surjective (as appropriate) map that extends the map $h_{j}^{\prime}: \operatorname{im}\left(e_{j}\right) \rightarrow \operatorname{im}\left(g_{a_{k}}\right)$ defined by $\left(x e_{j}\right) h_{j}^{\prime}=x g_{a_{j}}$ for $x \in\left[n_{a_{j}}\right]$. In Figure 4, we show that

$$
g=e_{1}^{\left(a_{1}\right)} \cdots e_{k-1}^{\left(a_{k-1}\right)} \cdot g_{a_{k}}^{\left(a_{k}\right)} \cdot e_{a_{k} a_{1} ; h_{1}} \cdots e_{a_{k} a_{k-1} ; h_{k-1}}
$$

(In the diagram, we picture the action of the transformations on $X_{A}=C_{a_{1}} \cup \cdots \cup C_{a_{k}}$, and the pictured ordering of the blocks is not meant to imply that $a_{1}<\cdots<a_{k}$.) Again, each $e_{j}^{\left(a_{j}\right)}$ belongs to $\left\langle G_{1}\right\rangle$, and clearly each $e_{a_{k} a_{j} ; h_{j}}$ belongs to $G_{2}$. This completes the proof.

Our next task is to calculate $\operatorname{rank}(S)$ and $\operatorname{idrank}(S)$. In order to do this, we will show that the generating set $G_{1} \cup G_{2}$ from Proposition 3.3 may be significantly reduced in size. The next sequence of results (specifically, Lemmas 3.4, 3.6, 3.8 and 3.13) show what kind of transformations are essential in any (idempotent) generating set.

Recall that $\mathcal{E}_{n_{i}}=\left\langle E\left(\mathcal{T}_{n_{i}}\right)\right\rangle=\{1\} \cup\left(\mathcal{T}_{n_{i}} \backslash \mathcal{S}_{n_{i}}\right)$. So $\mathcal{E}_{n_{i}}^{(i)}$, which consists of all maps $[1, \ldots, 1, f, 1, \ldots, 1 ; 1] \in \mathcal{T}(X, \mathcal{P})$ with $f \in \mathcal{E}_{n_{i}}$ in the $i$ th position, is a subsemigroup of $S$ isomorphic to $\mathcal{E}_{n_{i}}$. The proof of [3, Lemma 4.3] is easily adapted to prove the following lemma.

Lemma 3.4. Let $i \in[m]$. Then $S \backslash \mathcal{E}_{n_{i}}^{(i)}$ is an ideal of $S$. Consequently, any generating set for $S$ contains a generating set for $\mathcal{E}_{n_{i}}^{(i)}$.

Since the map $\underset{\mathcal{T}}{\mathcal{T}}(X, \mathcal{P}) \rightarrow \mathcal{T}_{m}: f \mapsto \bar{f}$ is a homomorphism, it follows from Proposition 3.1 that $\bar{f} \in \mathcal{E}_{m}=\{1\} \cup\left(\mathcal{T}_{m} \backslash \mathcal{S}_{m}\right)$ for all $f \in S$. We will frequently make use of this fact. The next simple result describes the preimage of $1 \in \mathcal{T}_{m}$ under the above map.

Figure 4. Diagrammatic proof that $g=e_{1}^{\left(a_{1}\right)} \cdots e_{k-1}^{\left(a_{k-1}\right)} \cdot g_{a_{k}}^{\left(a_{k}\right)} \cdot e_{a_{k} a_{1} ; h_{1}} \cdots e_{a_{k} a_{k-1} ; h_{k-1}}$.

Lemma 3.5. Let $f \in S$. If $\bar{f}=1$, then $f_{i} \in \mathcal{E}_{n_{i}}$ for all $i \in[m]$.
Proof. Let $f=h_{1} \cdots h_{k}$, where $h_{1}, \ldots, h_{k} \in E$, and write $h_{j}=\left[h_{j 1}, \ldots, h_{j m} ; \bar{h}_{j}\right]$ for each $j$. Since $1=\bar{f}=\bar{h}_{1} \cdots \bar{h}_{k}$, we see that $\bar{h}_{j}=1$ for all $j$. It follows that $h_{j i} \in E\left(\mathcal{T}_{n_{i}}\right)$ for each $i, j$ and so, $f_{i}=h_{1 i} \cdots h_{k i} \in\left\langle E\left(\mathcal{T}_{n_{i}}\right)\right\rangle=\mathcal{E}_{n_{i}}$ for each $i$.

For $1 \leq i<j \leq m$, we write $\varepsilon_{i j}=\varepsilon_{j i}$ for the equivalence relation on $[m]$ with unique nontrivial equivalence class $\{i, j\}$. Note that $\operatorname{ker}\left(e_{i j}\right)=\operatorname{ker}\left(e_{j i}\right)=\varepsilon_{i j}$. We also write $\Delta=\{(i, i): i \in[m]\}$ for the trivial equivalence on $[m]$ (that is, the equality relation on [m]).

Lemma 3.6. Let $1 \leq i<j \leq m$ and $f \in \operatorname{Inj}\left(n_{j}, n_{i}\right)$ and suppose that $e_{i j ; f}=g h$, where $g, h \in S$ and $g \neq 1$. Then:
(i) $\operatorname{ker}(\bar{g})=\varepsilon_{i j}$;
(ii) $g_{1}, \ldots, g_{m}$ are injective;
(iii) $g_{i} \in \mathcal{S}_{n_{i}}$ and $g_{j} g_{i}^{-1}=f$.

Consequently, any generating set for $S$ contains such an element $g$ for each such $i, j, f$. Further, if $g$ is an idempotent, then:
(iv) if $n_{i}=n_{j}$, then either $g=e_{i j ; f}$ or $g=e_{j i ; f^{-1}}$;
(v) if $n_{i}>n_{j}$, then $g=e_{i j ; f}$.

Proof. Now $\left[1, \ldots, 1, f, 1, \ldots, 1 ; e_{i j}\right]=e_{i j ; f}=g h=\left[g_{1} h_{1 \bar{g}}, \ldots, g_{m} h_{m \bar{g}} ; \bar{g} \bar{h}\right]$. Since each $g_{r} h_{r \bar{g}}$ is injective (equal to either 1 or $f$ ), it follows that each $g_{r}$ is injective, establishing (ii). If $\bar{g}=1$, then $g_{r} \in \mathcal{E}_{n_{r}}$ for each $r$ by Lemma 3.5; but the only injective element
of $\mathcal{E}_{n_{r}}$ is the identity element 1 , so $g_{r}=1$ for all $r$, giving $g=[1, \ldots, 1 ; 1]=1$, which is a contradiction. Consequently, $\bar{g} \neq 1$, whence $\bar{g} \in \mathcal{T}_{m} \backslash \mathcal{S}_{m}$. But then $\Delta \neq \operatorname{ker}(\bar{g}) \subseteq \operatorname{ker}(\bar{g} \bar{h})=\operatorname{ker}\left(e_{i j}\right)=\varepsilon_{i j}$, so $\operatorname{ker}(\bar{g})=\varepsilon_{i j}$, giving (i). Put $k=i \bar{g}=j \bar{g}$.

Next we claim that $n_{k}=n_{i}$. Indeed, suppose that this was not the case. Since $g_{i} \in$ $\operatorname{Inj}\left(n_{i}, n_{k}\right)$, we have $n_{i} \leq n_{k}$, so we must in fact have $n_{i}<n_{k}$. Let $L=\left\{r \in[m]: n_{r}>n_{i}\right\}$, noting that $k \in L$. Since $n_{1} \geq \cdots \geq n_{m}$, it follows that $L=[s]$ for some $s \geq 1$. Now, since $\bar{g}$ maps $[m] \backslash\{i, j\}$ injectively into $[m] \backslash\{k\}$, and since $s<i<j$, it follows that there exists $r \in L=[s]$ such that $r \bar{g}>s$. But then $g_{r} \in \mathcal{T}\left(n_{r}, n_{r}\right)$ with $n_{r \bar{g}} \leq n_{i}<n_{r}$, contradicting the fact that $g_{r}$ is injective. This completes the proof of the claim.

In particular, $g_{i} \in \operatorname{Inj}\left(n_{i}, n_{k}\right)=\operatorname{Inj}\left(n_{i}, n_{i}\right)=\mathcal{S}_{n_{i}}$. Also, $h_{k}=h_{i \bar{g}} \in \mathcal{T}\left(n_{k}, n_{i}\right)$, since $i=i e_{i j}=i \bar{g} \bar{h}=k \bar{h}$. We also have $1=g_{i} h_{k}$, so $h_{k}=g_{i}^{-1}$, from which it follows that $f=g_{j} h_{j \bar{g}}=g_{j} h_{k}=g_{j} g_{i}^{-1}$, completing the proof of (iii).

Next suppose that $G$ is an arbitrary generating set for $S$. By considering an expression $e_{i j ; f}=h_{1} \cdots h_{k}$, where $h_{1}, \ldots, h_{k} \in G \backslash\{1\}$, we see that $h_{1} \in G$ satisfies conditions (i)-(iii).

Finally, suppose that $g$ is an idempotent. Since $\bar{g} \in E\left(\mathcal{T}_{m}\right)$ by Proposition 3.1, and since $\operatorname{ker}(\bar{g})=\varepsilon_{i j}$, it follows that $\bar{g}=e_{i j}$ or $\bar{g}=e_{j i}$. Suppose first that $\bar{g}=e_{i j}$. Proposition 3.1 also gives $g_{r} \in E\left(\mathcal{T}_{n_{r}}\right)$ for each $r \in \operatorname{im}(\bar{g})=[m] \backslash\{j\}$; but each $g_{r}$ is injective, so it follows that $g_{r}=1$ if $r \neq j$. We also have $f=g_{j} g_{i}^{-1}=g_{j}$, giving $g=e_{i j ; f}$. Next suppose that $\bar{g}=e_{j i}$. In particular, $n_{i}=n_{j}$ as $g_{i} \in \operatorname{Inj}\left(n_{i}, n_{j}\right)$ and $n_{i} \geq n_{j}$. Again, we have $g_{r}=1$ for all $r \in[m] \backslash\{i\}$, and this time we have $f=g_{j} g_{i}^{-1}=g_{i}^{-1}$, which gives $g_{i}=f^{-1}$ and $g=e_{j i, f^{-1}}$. This completes the proof.

Let $i, j \in[m]$ with $n_{i}>n_{j}$. From the previous result, we see that any idempotent generating set $G$ for $S$ contains all of $\left\{e_{i k ; f}: k \in[m], n_{k}=n_{j}, f \in \operatorname{Inj}\left(n_{j}, n_{i}\right)\right\}$. It might be tempting to guess that $G$ must also contain all of $\left\{e_{k i, f}\right.$ : $\left.k \in[m], n_{k}=n_{j}, f \in \operatorname{Surj}\left(n_{i}, n_{j}\right)\right\}$. But this is far from the case. In fact, $G$ need only contain a single element of the latter set, as we show in Lemma 3.8 and Proposition 3.15; the proof of the former requires the next technical result (which will also be useful elsewhere).

Lemma 3.7. Let $j \in[n]$ and put $L=\left\{q \in[m]: n_{q}>j\right\}$. Suppose that $f \in S$ is such that $\left.\bar{f}\right|_{L}$ is injective and $\left|C_{q} f\right|>j$ for all $q \in L$. Then $\left.\bar{f}\right|_{L}=\mathrm{id}_{L}$ and $f_{q} \in \mathcal{E}_{n_{q}}$ for all $q \in L$.

Proof. If $L=\emptyset$, there is nothing to show, so suppose that $L \neq \emptyset$. By Proposition 3.3, we may write $f=g_{1} \cdots g_{k}$, where $g_{1}, \ldots, g_{k} \in E$ and $\operatorname{rank}\left(\bar{g}_{l}\right) \geq m-1$ for each $l \in[k]$. (We could be more specific by insisting that $g_{1}, \ldots, g_{k} \in G_{1} \cup G_{2}$, but it will be convenient later to argue more generally, as we do here.) We claim that $\left.\bar{g}_{l}\right|_{L}=\operatorname{id}_{L}$ for each $l$. Indeed, suppose that this is not the case and let $l \in[k]$ be minimal so that $\left.\bar{g}_{l}\right|_{L} \neq \mathrm{id}_{L}$. Since $\bar{g}_{l} \neq 1$, it follows that $\operatorname{rank}\left(\bar{g}_{l}\right)=m-1$, so $\bar{g}_{l}=e_{a b}$ for some $a, b \in[m]$ with $a \neq b$. Note that at least one of $a, b$ belongs to $L$, since $\left.\bar{g}_{l}\right|_{L} \neq \mathrm{id}_{L}$. We could not have $a, b \in L$, for then $\left(a \bar{g}_{1} \cdots \bar{g}_{l-1}\right) \bar{g}_{l}=a \bar{g}_{l}=b \bar{g}_{l}=\left(b \bar{g}_{1} \cdots \bar{g}_{l-1}\right) \bar{g}_{l}$, giving $a \bar{f}=b \bar{f}$, contradicting the assumption that $\left.\bar{f}\right|_{L}$ is injective. We also could not have $a \in L$,
for then $b \in[m] \backslash L$, so $\left.\bar{g}_{l}\right|_{L}=\mathrm{id}_{L}$, which is another contradiction. So $a \in[m] \backslash$ $L$ and $b \in L$. But then $\left|C_{b} f\right|=\left|C_{b} g_{1} \cdots g_{k}\right| \leq\left|\left(C_{b} g_{1} \cdots g_{l-1}\right) g_{l}\right| \leq\left|C_{b} g_{l}\right| \leq\left|C_{a}\right| \leq j$, contradicting the assumption that $\left|C_{q} f\right|>j$ for all $q \in L$. This establishes the claim that $\left.\bar{g}_{l}\right|_{L}=\operatorname{id}_{L}$ for each $l$. It obviously follows that $\left.\bar{f}\right|_{L}=\operatorname{id}_{L}$. For $l \in[k]$, write $g_{l}=\left[g_{l 1}, \ldots, g_{l m} ; \bar{g}_{l}\right]$. Since $L \subseteq \operatorname{im}\left(\bar{g}_{l}\right)$ and $g_{l} \in E$ for each $l \in[k]$, it follows from Proposition 3.1 that $g_{l q} \in E\left(\mathcal{T}_{n_{q}}\right)$ for each $l \in[k]$ and $q \in L$. Since $\left.\bar{g}_{l}\right|_{L}=\mathrm{id}_{L}$ for all $l \in[k]$, it follows that $f_{q}=g_{1 q} \cdots g_{k q} \in \mathcal{E}_{n_{q}}$ for each $q \in L$.
Lemma 3.8. Let $i, j \in[m]$ be such that $n_{i}>n_{j}$ and let $f \in \operatorname{Surj}\left(n_{i}, n_{j}\right)$. Suppose that $e_{j i, f}=g_{1} \cdots g_{r}$, where $g_{1}, \ldots, g_{r} \in S \backslash\{1\}$. Put $L=\left\{q \in[m]: n_{q}>n_{j}\right\}$. Let $l \in[r]$ be minimal such that $\left.\bar{g}_{l}\right|_{L} \neq \mathrm{id}_{L}$. Let $h=g_{l}$ and write $h=\left[h_{1}, \ldots, h_{m} ; \bar{h}\right]$. Then:
(i) $\operatorname{rank}(\bar{h})=m-1$;
(ii) $\left|C_{i} h\right|=n_{j}$;
(iii) $h_{q}$ is injective for all $q \in L \backslash\{i\}$.

Consequently, any generating set for $S$ contains such an element $h$ for each such $i, j$.
Further, if $h$ is an idempotent, then $h=e_{k i, f^{\prime}}$ for some $k \in[m]$ with $n_{k}=n_{j}$ and some $f^{\prime} \in \operatorname{Surj}\left(n_{i}, n_{j}\right)$.

Proof. First note that $\bar{h} \neq 1$, since $\left.\bar{h}\right|_{L} \neq \mathrm{id}_{L}$, so $\bar{h} \in \mathcal{T}_{m} \backslash \mathcal{S}_{m}$ and $\operatorname{rank}(\bar{h}) \leq m-1$. But also $\operatorname{rank}(\bar{h}) \geq \operatorname{rank}\left(e_{j i}\right)=m-1$, so (i) holds.

Next suppose that (ii) does not hold. First note that $n_{j}=\left|C_{j}\right|=\left|C_{i} e_{j i, f}\right|=$ $\left|C_{i} g_{1} \cdots g_{r}\right| \leq\left|\left(C_{i} g_{1} \cdots g_{l-1}\right) h\right| \leq\left|C_{i} h\right|$, since $\bar{g}_{1} \cdots \bar{g}_{l-1}$ acts as the identity on $L$ and $i \in L$. So, since we are assuming that $\left|C_{i} h\right| \neq n_{j}$, we must have $\left|C_{i} h\right|>n_{j}$. A similar calculation shows that $n_{q} \leq\left|C_{q} h\right|$ for any $q \in L \backslash\{i\}$. In particular, together with the assumption that $\left|C_{i} h\right|>n_{j}$, this gives $\left|C_{q} h\right|>n_{j}$ for all $q \in L$. Since $\left.\left(\bar{g}_{1} \cdots \bar{g}_{l-1} \bar{h} \bar{g}_{l+1} \cdots \bar{g}_{r}\right)\right|_{L}=e_{\left.j i\right|_{L}}$ is injective, and since $\left.\left(\bar{g}_{1} \cdots \bar{g}_{l-1}\right)\right|_{L}=\mathrm{id}_{L}$, it follows that $\left.\bar{h}\right|_{L}$ is injective. But then Lemma 3.7 says that $\left.\bar{h}\right|_{L}=\mathrm{id}_{L}$, which is a contradiction. This completes the proof of (ii).

Next let $q \in L \backslash\{i\}$ be arbitrary. We have already seen that $\left|C_{q} h\right| \geq n_{q}$. But we also trivially have $\left|C_{q} h\right| \leq\left|C_{q}\right|=n_{q}$, whence $\left.h\right|_{C_{q}}$ is injective, and (iii) holds. As in the proof of Lemma 3.6, the statement about the generating set $G$ follows quickly.

Finally, suppose that $h$ is an idempotent. Since $\bar{h} \in E\left(\mathcal{T}_{m}\right)$ and $\operatorname{rank}(\bar{h})=m-1$, it follows that $\bar{h}=e_{a b}$ for some $a, b \in[m]$ with $a \neq b$. Since $\left.\left(\bar{g}_{1} \cdots \bar{g}_{l-1}\right)\right|_{L}=\mathrm{id}_{L}$ but $\left.\left(\bar{g}_{1} \cdots \bar{g}_{l-1} \bar{h}\right)\right|_{L} \neq \mathrm{id}_{L}$, we again conclude that $a \in[m] \backslash L$ and $b \in L$. We observe that $b=i$. Indeed, if this was not the case, then we would have $\left|C_{b} h\right| \leq\left|C_{a}\right|=n_{a}<n_{b}$, contradicting the fact that $h_{q}$ is injective for all $q \in L \backslash\{i\}$. In particular, $\bar{h}=e_{a i}$. So $h$ maps $C_{i}$ into $C_{a}$, which gives $n_{j}=\left|C_{i} h\right| \leq\left|C_{a}\right|=n_{a}$. But also $n_{a} \leq n_{j}$ since $a \in[m] \backslash L$, so it follows that $n_{a}=n_{j}$. So far we know that

$$
h=\left[h_{1}, \ldots, h_{i}, \ldots, h_{m} ; e_{a i}\right] .
$$

Since we know that $h$ maps $C_{i}$ into $C_{a}$ and $\left|C_{i} h\right|=n_{j}=\left|C_{a}\right|$, it follows that $h_{i} \in$ $\operatorname{Surj}\left(n_{i}, n_{j}\right)$. We wish to show that $h=e_{a i ; h_{i}}$. This will complete the proof of the lemma
(with $k=a$ and $f^{\prime}=h_{i}$ ). It remains to show that $h_{q}=1$ for all $q \in[m] \backslash\{i\}$. In fact, since $h$ is an idempotent, and since $\operatorname{im}(\bar{h})=\operatorname{im}\left(e_{a i}\right)=[m] \backslash\{i\}$, we already know that $h_{q} \in E\left(\mathcal{T}_{n_{q}}\right)$ for all $q \in[m] \backslash\{i\}$, so it suffices to show that each such $h_{q}$ is injective. We already know that this is the case for $q \in L \backslash\{i\}$. We also know that $C_{a}=C_{i} h \subseteq C_{a} h$ by Proposition 3.1(iii), so it follows that $h_{a}$ is surjective. But all surjective transformations of a finite set are injective, so it follows that $h_{a}$ is injective. It remains to establish the injectivity of each $h_{q}$ with $q \in[m] \backslash(L \cup\{a\})$. To do this, we must consider two separate cases. To simplify notation, put $u=g_{1} \cdots g_{l-1}$ and $v=g_{l} \cdots g_{r}$, and write $u=\left[u_{1}, \ldots, u_{m} ; \bar{u}\right]$ and $v=\left[v_{1}, \ldots, v_{m} ; \bar{v}\right]$. Since $e_{j i ; f}=u v=\left[u_{1} v_{1 \bar{u}}, \ldots, u_{m} v_{m \bar{u}} ; \overline{u v}\right]$, it follows that $u_{q}$ is injective for all $q \in[m] \backslash\{i\}$. Similarly, $u_{q} h_{q \bar{u}}$ is injective for all such $q$.
Case 1. Suppose first that $\bar{u}=1$. Then $u_{q} \in \mathcal{E}_{n_{q}}$ for each $q \in[m]$. Since $u_{q}$ is injective for each $q \in[m] \backslash\{i\}$, it follows that $u_{q}=1$ for each such $q$. So

$$
u h=\left[u_{1} h_{1}, \ldots, u_{m} h_{m} ; e_{a i}\right]=\left[h_{1}, \ldots, h_{i-1}, u_{i} h_{i}, h_{i+1}, \ldots, h_{m} ; e_{a i}\right] .
$$

In particular, for any $q \in[m] \backslash\{i\}, h_{q}=u_{q} h_{q}=u_{q} h_{q \bar{u}}$ is injective, as noted above. This completes the proof in this case.

Case 2. Finally, suppose that $\bar{u} \neq 1$, so $\bar{u} \in \mathcal{T}_{m} \backslash \mathcal{S}_{m}$. Since $\varepsilon_{i j}=\operatorname{ker}\left(e_{j i}\right)=\operatorname{ker}(\bar{u} \bar{v}) \supseteq$ $\operatorname{ker}(\bar{u}) \neq \Delta$, it follows that $\operatorname{ker}(\bar{u})=\varepsilon_{i j}$. We claim that $a \notin \operatorname{im}(\bar{u})$. Indeed, suppose that this was not the case, so that $a=c \bar{u}$ for some $c \in[m]$. Since $\left.\bar{u}\right|_{L}=\operatorname{id}_{L}$ and $j \bar{u}=i \bar{u}$, it follows that $\bar{u}$ maps $L \cup\{j\}$ into $L$, so $c \in[m] \backslash(L \cup\{j\})$. But then

$$
\begin{aligned}
c e_{j i}=c \bar{g}_{1} \cdots \bar{g}_{r} & =c \bar{u} e_{a i} \bar{g}_{l+1} \cdots \bar{g}_{r}=a e_{a i} \bar{g}_{l+1} \cdots \bar{g}_{r}=i e_{a i} \bar{g}_{l+1} \cdots \bar{g}_{r} \\
& =i \bar{u} e_{a i} \bar{g}_{l+1} \cdots \bar{g}_{r}=i e_{j i}=j,
\end{aligned}
$$

which is a contradiction, since $c \notin\{i, j\}$. This completes the proof of the claim that $a \notin \operatorname{im}(\bar{u})$. Since $\operatorname{rank}(\bar{u})=m-1$, it follows that $\operatorname{im}(\bar{u})=[m] \backslash\{a\}$. Let $Q=[m] \backslash L$, and put

$$
Y=\bigcup_{q \in Q \backslash j\}} C_{q} \quad \text { and } \quad Z=\bigcup_{q \in Q \backslash\{a\}} C_{q} .
$$

Since $\left|C_{a}\right|=n_{j}=\left|C_{j}\right|$, it follows that $|Y|=|Z|$. Since $\bar{u}$ maps $Q \backslash\{j\}$ bijectively onto $Q \backslash\{a\}$, and since $u_{p}$ is injective for all $p \in Q$, it follows that $u_{p}$ is bijective for each $p \in Q \backslash\{j\}$. Now let $q \in Q \backslash\{a\}$ be arbitrary. Since $Q \backslash\{a\}=[m] \backslash(L \cup\{a\})$, the proof of the lemma will be complete if we can show that $h_{q}$ is injective. Put $p=q \bar{u}^{-1} \in Q \backslash\{j\}$. Note that

$$
u h=\left[u_{1} h_{1 \bar{u}}, \ldots, u_{p} h_{q}, \ldots, u_{m} h_{m \bar{u}} ; \bar{u} e_{a i}\right] .
$$

Since $u_{p} h_{q}$ is injective, and since $u_{p}$ is bijective, it follows that $h_{q}$ is injective. As noted above, this completes the proof of the lemma.

We are now able to give a lower bound for $\operatorname{rank}(S)$. The next result is stated in terms of the parameters $\mu_{i}, v_{i}, \rho_{i}$ introduced at the beginning of this section and in Theorem 2.1.

Corollary 3.9. We have $\operatorname{rank}(S) \geq \rho$, where

$$
\rho=\sum_{i=1}^{n}\left(\mu_{i} \rho_{i}+i!\binom{\mu_{i}}{2}+\mu_{i} v_{i}\right)+\sum_{1 \leq i<j \leq n} \mu_{i} \mu_{j} \frac{j!}{(j-i)!} .
$$

Proof. Let $G$ be an arbitrary generating set for $S$. By Lemma 3.4, $G$ contains a generating set for $\mathcal{E}_{n_{r}}^{(r)}$ for each $r \in[m]$. These are pairwise disjoint and each has size at least $\operatorname{rank}\left(\mathcal{E}_{n_{r}}\right)=\rho_{n_{r}}$, so $G$ contains at least

$$
\begin{equation*}
\sum_{r=1}^{m} \rho_{n_{r}}=\sum_{i=1}^{n} \mu_{i} \rho_{i} \tag{3.1}
\end{equation*}
$$

transformations coming from these generating sets of $\mathcal{E}_{n_{1}}^{(1)}, \ldots, \mathcal{E}_{n_{m}}^{(m)}$.
Next fix some $i \in[n]$ with $\mu_{i} \geq 2$. Lemma 3.6 tells us that for each $p, q \in M_{i}$ with $p<q$, and for each $f \in \mathcal{S}_{i}, G$ contains some transformation $g$ such that:
(i) $\operatorname{ker}(\bar{g})=\varepsilon_{p q}$;
(ii) $g_{1}, \ldots, g_{m}$ are injective;
(iii) $g_{p} \in \mathcal{S}_{i}$ and $g_{q} g_{p}^{-1}=f$.
(For future reference, we note that if this $g$ is an idempotent, then Lemma 3.6 gives $g=e_{i j ; f}$ or $e_{j i, f^{-1}}$.) There are $\binom{\mu_{i}}{2}$ such $p, q$, and there are $i!$ such $f$. Summing over all appropriate $i$, and noting that $\binom{\mu_{i}}{2}=0$ if $\mu_{i} \leq 1$, we see that $G$ contains at least

$$
\begin{equation*}
\sum_{i \in[n]} i!\binom{\mu_{i}}{2}=\sum_{i=1}^{n} i!\binom{\mu_{i}}{2} \tag{3.2}
\end{equation*}
$$

transformations of this type.
Next suppose that $1 \leq p<q \leq m$ are such that $n_{p}>n_{q}$. Let $f \in \operatorname{Inj}\left(n_{q}, n_{p}\right)$ be arbitrary. Lemma 3.6 tells us that $G$ must contain a transformation $g$ such that:
(i) $\operatorname{ker}(\bar{g})=\varepsilon_{p q}$;
(ii) $g_{1}, \ldots, g_{m}$ are injective;
(iii) $g_{p} \in \mathcal{S}_{n_{p}}$ and $g_{q} g_{p}^{-1}=f$.

There are $\left|\operatorname{Inj}\left(n_{q}, n_{p}\right)\right|=n_{p}!/\left(n_{p}-n_{q}\right)$ ! such transformations. For $1 \leq i<j \leq n$, there are $\mu_{i} \mu_{j}$ choices of $1 \leq p<q \leq m$ with $j=n_{p}$ and $i=n_{q}$, so $G$ contains at least

$$
\begin{equation*}
\sum_{\substack{1 \leq p<q \leq m \\ n_{p}>n_{q}}} \frac{n_{p}!}{\left(n_{p}-n_{q}\right)!}=\sum_{1 \leq i<j \leq n} \mu_{i} \mu_{j} \frac{j!}{(j-i)!} \tag{3.3}
\end{equation*}
$$

transformations of this type.
Finally, let $i \in[n]$ be such that $\mu_{i} \neq 0$, and suppose that $p \in[m]$ is such that $n_{p}=i$. Let $L=\left\{q \in[m]: n_{q} \geq i\right\}$. If $1 \leq j<i$ is such that $\mu_{j} \neq 0$, then Lemma 3.8 says that $G$ must contain some transformation $g$ such that:
(i) $\quad \operatorname{rank}(\bar{g})=m-1$;
(ii) $\left|C_{p} g\right|=j$;
(iii) $g_{q}$ is injective for all $q \in L \backslash\{i\}$.

There are $\mu_{i}$ such $p$ and $v_{i}$ such $j$, so $G$ contains at least

$$
\begin{equation*}
\sum_{\substack{i \in[n] \\ \mu_{i} \neq 0}} \mu_{i} v_{i}=\sum_{i=1}^{n} \mu_{i} v_{i} \tag{3.4}
\end{equation*}
$$

transformations of this type. Finally, adding equations (3.1)-(3.4) shows that $|G| \geq \rho$. Since $G$ is an arbitrary generating set, the result follows.

We show below that this lower bound for $\operatorname{rank}(S)$ is precise (see Theorem 3.16). In fact, we will also show that $\operatorname{idrank}(S)=\operatorname{rank}(S)$ apart from the special case in which $\mu_{1}=2$. In order to deal with that case, we need Lemma 3.13 below, which will also be useful when we later classify and enumerate the minimal idempotent generating sets for $S$ (Theorem 3.17). But first we need a number of technical results.

Let $i \in[n]$. Recall that $M_{i}=\left\{q \in[m]: n_{q}=i\right\}$. Let $X_{i}=\bigcup_{q \in M_{i}} C_{q}$, and put

$$
S_{i}=\left\{f \in S:\left.f\right|_{X \backslash X_{i}}=\operatorname{id}_{X \backslash X_{i}}, X_{i} f \subseteq X_{i}\right\} .
$$

The reader should not confuse $S_{i}$ with $\mathcal{S}_{i}$, the symmetric group on [i]. Let $\mathcal{P}_{i}=\left\{C_{q}\right.$ : $\left.q \in M_{i}\right\}$. So $\mathcal{P}_{i}$ is a uniform partition of $X_{i}$ into $\mu_{i}$ blocks of size $i$. We aim to show that $S_{i}$ is isomorphic to $\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$, the idempotent generated subsemigroup of $\mathcal{T}\left(X_{i}, \mathcal{P}_{i}\right)$. The following proposition was proved in [3, Proposition 4.1].

Proposition 3.10. Let $i \in[n]$, and write $M_{i}=\left\{q_{1}, \ldots, q_{\mu_{i}}\right\}$. Then $f=\left[f_{q_{1}}, \ldots, f_{q_{\mu_{i}}} ; \bar{f}\right] \in$ $\mathcal{T}\left(X_{i}, \mathcal{P}_{i}\right)$ belongs to $\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$ if and only if one of the following holds:
(i) $\bar{f}=1$ and $f_{q_{1}}, \ldots, f_{q_{\mu_{i}}} \in \mathcal{E}_{i}$;
(ii) $\bar{f} \in \mathcal{T}_{X_{i}} \backslash \mathcal{S}_{X_{i}}$.

Lemma 3.11. Let $i \in[n]$. Then $S_{i}$ is isomorphic to $\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$.
Proof. There is an obvious embedding $\phi: \mathcal{T}\left(X_{i}, \mathcal{P}_{i}\right) \rightarrow \mathcal{T}(X, \mathcal{P})$ defined, for $f \in$ $\mathcal{T}\left(X_{i}, \mathcal{P}_{i}\right)$, by

$$
x(f \phi)= \begin{cases}x f & \text { if } x \in X_{i}, \\ x & \text { if } x \in X \backslash X_{i} .\end{cases}
$$

So $\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$ is isomorphic to its image, $T=\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right) \phi$. It remains to show that $S_{i}=T$. Clearly, $T \subseteq S_{i}$. Conversely, suppose that $f \in S_{i}$, and put $g=\left.f\right|_{X_{i}} \in \mathcal{T}\left(X_{i}, \mathcal{P}_{i}\right)$. Obviously, $f=g \phi$, so it suffices to prove that $g \in \mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$. But this follows quickly from Lemma 3.5 and Proposition 3.10.

Next we aim to show that any idempotent generating set for $S$ must contain a generating set for each $S_{i}$. To do this, we require the next technical result.

Lemma 3.12. Let $r \in[n]$ with $\mu_{r} \neq 0$, and let $h \in S$ be such that $\operatorname{rank}(\bar{h})=m-1$, $M_{r} \bar{h} \subseteq M_{r},\left|M_{r} \bar{h}\right|=\mu_{r}-1$ and $h_{q}$ is injective for all $q \in[m]$. Suppose also that $g \in E \backslash S_{r}$ is such that $\operatorname{rank}(\bar{h} \bar{g})=m-1$ and $(h g)_{q}$ is injective for all $q \in[m]$. Then $\left.g\right|_{Y}=\mathrm{id}_{Y}$, where $Y=X_{r} h$. In particular, $\left.(h g)\right|_{X_{r}}=\left.h\right|_{X_{r}}$.

Proof. It is clear that $\left.(h g)\right|_{X_{r}}=\left.h\right|_{X_{r}}$ follows from $\left.g\right|_{Y}=\mathrm{id}_{Y}$, so we just prove the latter. By assumption, we have $M_{r} \bar{h}=M_{r} \backslash\{a\}$ for some $a \in M_{r}$. Note that $m-1=$ $\operatorname{rank}(\bar{h} \bar{g}) \leq \operatorname{rank}(\bar{g}) \leq m$. We now break up the proof into cases, according to whether $\operatorname{rank}(\bar{g})=m$ or $m-1$.

Case 1. Suppose first that $\operatorname{rank}(\bar{g})=m$. So $\bar{g}=1$ and $g_{q} \in E\left(\mathcal{T}_{n_{q}}\right)$ for all $q \in[m]$. Let $q \in M_{r} \backslash\{a\}$ and suppose that $q=p \bar{h}$, where $p \in M_{r}$. Then $(h g)_{p}=h_{p} g_{p \bar{h}}=h_{p} g_{q}$. But $h_{p}$ and $(h g)_{p}$ are injective, by assumption. Since $p \bar{h}=q \in M_{r}$, it follows that $h_{p} \in \mathcal{S}_{r}$, so in fact $g_{q}=h_{p}^{-1}(h g)_{p}$ is injective. Since also $g_{q} \in E\left(\mathcal{T}_{r}\right)$, as noted above, we conclude that $g_{q}=1$. Since this is true for all $q \in M_{r} \backslash\{a\}$, and since $\bar{g}=1$, it follows that $\left.g\right|_{Y}=\mathrm{id}_{Y}$, as desired.

Case 2. Suppose now that $\operatorname{rank}(\bar{g})=m-1$. Since $g \in E$, we must have $\bar{g}=e_{b c}$ for some $b, c \in[m]$ with $b \neq c$. Since $\operatorname{rank}(\bar{h} \bar{g})=\operatorname{rank}(\bar{h})=m-1$, we cannot have both $b, c \in \operatorname{im}(\bar{h})$. We also have $g_{q} \in E\left(\mathcal{T}_{n_{q}}\right)$ for all $q \in \operatorname{im}(\bar{g})=[m] \backslash\{c\}$. We now consider two subcases, according to whether $a$ belongs to im( $\bar{h})$ or not.
Subcase 2.1. Suppose first that $a \notin \operatorname{im}(\bar{h})$. Since $b, c$ do not both belong to $\operatorname{im}(\bar{h})$, we must have either $b=a$ or $c=a$. Suppose first that $c=a$. Note that $\left.\bar{g}\right|_{\left.M_{r} \backslash a\right\}}=\operatorname{id}_{\left.M_{r} \backslash a\right\}}$ and $g_{q} \in E\left(\mathcal{T}_{r}\right)$ for all $q \in M_{r} \backslash\{a\}$, so, as in Case 1, we conclude that $g_{q}=1$ for all such $q$ and, therefore, $\left.g\right|_{Y}=\mathrm{id}_{Y}$. Now suppose that $b=a$. If $c \notin M_{r}$, then again $\left.\bar{g}\right|_{M_{r} \backslash\{a\}}=\mathrm{id}_{M_{r} \backslash\{a\}}$ and $g_{q} \in E\left(\mathcal{T}_{r}\right)$ for all $q \in M_{r} \backslash\{a\}$, and the proof concludes as above. So, suppose that $c \in M_{r}$. In fact, we will show that this case is not possible. Since $\operatorname{im}(\bar{h})=[m] \backslash\{a\}$ and $M_{r} \bar{h} \subseteq M_{r}$, it follows that $\bar{h}$ maps $[m] \backslash M_{r}$ bijectively into $[m] \backslash M_{r}$. But $h_{q}$ is injective for all $q \in[m] \backslash M_{r}$, so it follows that $\left.h\right|_{X \backslash X_{r}} \in \mathcal{T}_{X \backslash X_{r}}$ is injective and hence bijective. We deduce that $h_{q}$ is bijective for all $q \in[m] \backslash M_{r}$. Let $q \in[m] \backslash M_{r}$, and put $p=q \bar{h}^{-1}$. Since $(g h)_{p}=h_{p} g_{q}$ is injective, it follows that $g_{q}$ is injective. But also $g_{q} \in E\left(\mathcal{T}_{n_{q}}\right)$ for all such $q$, giving $g_{q}=1$ for $q \in[m] \backslash M_{r}$. Since also $\left.\bar{g}\right|_{[m] \backslash M_{r}}=\mathrm{id}_{[m] \backslash M_{r}}$, we would have $g \in S_{r}$, which is a contradiction. This completes the proof in Subcase 2.1.

Subcase 2.2. Finally, suppose that $a \in \operatorname{im}(\bar{h})$. As before, if $c \notin M_{r} \backslash\{a\}$, then $\left.g\right|_{Y}=\mathrm{id}_{Y}$ quickly follows. Now, suppose that $c \in M_{r} \backslash\{a\}$. Actually, we will show that this is impossible. In particular, $c \in \operatorname{im}(\bar{h})$, so $b \notin \operatorname{im}(\bar{h})$. Next we claim that $n_{b}<r$. Indeed, suppose that this is not the case. Note first that $b \notin \operatorname{im}(\bar{h})$ implies that $n_{b} \neq r$, since $M_{r} \subseteq \operatorname{im}(\bar{h})$ and so we must have $n_{b}>r$. Then some $q \in[m]$ with $n_{q}>r$ is mapped by $\bar{h}$ to some $p \in[m]$ with $n_{p} \leq r<n_{q}$. But then $\left|C_{q} h\right| \leq\left|C_{p}\right|<\left|C_{q}\right|$, contradicting the fact that $h_{q}$ is injective. This completes the proof of the claim that $n_{b}<r$. But now let
$q \in M_{r}$ be such that $q \bar{h}=c$. Then $\left|C_{q} h g\right| \leq\left|C_{c} g\right| \leq\left|C_{b}\right|=n_{b}<r=\left|C_{q}\right|$, contradicting the assumption that $(h g)_{q}$ is injective. This completes the proof.

Lemma 3.13. Let $U$ be an arbitrary idempotent generating set for $S$, and let $r \in[n]$. Then $U \cap S_{r}$ is a generating set for $S_{r}$.

Proof. If $\mu_{r}=0$, then $S_{r}=\{1\}=\langle\emptyset\rangle$, and the result is trivially true. So, suppose that $\mu_{r} \geq 1$, and write $U_{r}=U \cap S_{r}$. By Lemma 3.11 and [3, Corollary 4.2], $S_{r}$ is generated by all elements of the form:
(a) $e_{i j}^{(k)}$ for $i, j \in[r]$ with $i \neq j$ and all $k \in M_{r}$; and
(b) $e_{i j ; f}$ for $i, j \in M_{r}$ with $i \neq j$ and all $f \in \mathcal{S}_{r}$.

So it suffices to show that $\left\langle U_{r}\right\rangle$ contains each element of types (a) and (b). Now, for each $k \in M_{r}, U$ contains a generating set $V$ for $\mathcal{E}_{n_{k}}^{(k)}=\mathcal{E}_{r}^{(k)}$ by Lemma 3.4, and we clearly have $V \subseteq U_{r}$. In particular, $\left\langle U_{r}\right\rangle$ contains all elements of type (a). So now fix $f \in \mathcal{S}_{r}$ and $i, j \in M_{r}$ with $i \neq j$. Consider an expression $e_{i j ; f}=g_{1} \cdots g_{k}$, where $g_{1}, \ldots, g_{k} \in U \backslash\{1\}$. Let $L=\left\{q \in[k]: g_{q} \in U_{r}\right\}$, and write $L=\left\{q_{1}, \ldots, q_{l}\right\}$, where $q_{1}<\cdots<q_{l}$. We first aim to show that $\left.\left(g_{1} \cdots g_{k}\right)\right|_{X_{r}}=\left.\left(g_{q_{1}} \cdots g_{q_{l}}\right)\right|_{X_{r}}$.

For $p \in[k]$, let $h_{p}=g_{1} \cdots g_{p}$, and write $h_{p}=\left[h_{p 1}, \ldots, h_{p m} ; \bar{h}_{p}\right]$. We claim that for all $p \in[k]$ :
(i) $\quad h_{p q}$ is injective for all $q \in[m]$;
(ii) $\operatorname{rank}\left(\bar{h}_{p}\right)=m-1$;
(iii) $M_{r} \bar{h}_{p} \subseteq M_{r}$;
(iv) $\left|M_{r} \bar{h}_{p}\right|=\mu_{r}-1$.

By Lemma 3.6, $h_{1}=g_{1}=e_{i j ; f}$ or $e_{j i ; f-1}$, so the claim is true for $p=1$. Now suppose that (i)-(iv) all hold for some $1 \leq p<k$. Since $e_{i j ; f}=h_{p+1} g_{p+2} \cdots g_{k}$, it is clear that each $h_{p+1, q}$ is injective, so (i) holds. Next, note that $m-1=\operatorname{rank}\left(\bar{g}_{1}\right) \leq$ $\operatorname{rank}\left(\bar{h}_{p+1}\right) \leq \operatorname{rank}\left(e_{i j}\right)=m-1$, giving (ii). Next, we have $\left|M_{r} \bar{h}_{p+1}\right| \leq\left|M_{r} \bar{g}_{1}\right|=\mu_{r}-1$. But rank $\left(\bar{h}_{p+1}\right)=m-1$, so $\left|A \bar{h}_{p+1}\right| \geq|A|-1$ for any subset $A \subseteq[m]$, and (iv) follows. For (iii), note that the induction hypothesis gives $M_{r} \bar{h}_{p} \subseteq M_{r}$. If $g_{p+1} \in S_{r}$, then $M_{r} \bar{g}_{p+1} \subseteq M_{r}$ by definition, so $M_{r} \bar{h}_{p+1}=M_{r} \bar{h}_{p} \bar{g}_{p+1} \subseteq M_{r}$. If $g_{p+1} \notin S_{r}$, then all the conditions of Lemma 3.12 are satisfied (with $h=h_{p}$ and $g=g_{p+1}$ ). We conclude then that $\left.g_{p+1}\right|_{Y}=\mathrm{id}_{Y}$, where $Y=X_{r} h_{p}$. In particular, $\left.\bar{g}_{p+1}\right|_{M_{r} \bar{h}_{p}}=\mathrm{id}_{M_{r} \bar{h}_{p}}$. But then $M_{r} \bar{h}_{p+1}=M_{r} \bar{h}_{p} \bar{g}_{p+1}=M_{r} \bar{h}_{p} \subseteq M_{r}$. This completes the proof of the inductive step and, hence, of the claim.

Now suppose that $p \in[k]$ is such that $g_{p} \notin S_{r}$. In particular, $p \geq 2$ (since $g_{1} \in S_{r}$, as noted above). By the above claim (and as noted in its proof), the conditions of Lemma 3.12 are satisfied (for $h=h_{p-1}$ and $g=g_{p}$ ), so we conclude that $\left.h_{p}\right|_{X_{r}}=h_{p-1} \mid X_{r}$. So if $Q=[k] \backslash L=\left\{p \in[k]: g_{p} \notin U_{r}\right\}$ and $Q=\left\{p_{1}, \ldots, p_{s}\right\}$, where $s=k-l$ and
$p_{1}<\cdots<p_{s}$, then

$$
\begin{aligned}
\left.e_{i j ; f}\right|_{X_{r}}=\left.\left(g_{1} \cdots g_{k}\right)\right|_{X_{r}} & =\left.h_{p_{s}}\right|_{X_{r}}\left(g_{p_{s}+1} \cdots g_{k}\right) \\
& =\left.h_{p_{s}-1}\right|_{X_{r}}\left(g_{p_{s}+1} \cdots g_{k}\right) \\
& =\left.h_{p_{s-1}}\right|_{X_{r}}\left(g_{p_{s-1}+1} \cdots g_{p_{s}-1}\right)\left(g_{p_{s}+1} \cdots g_{k}\right) \\
& =\left.h_{p_{s-1}-1}\right|_{X_{r}}\left(g_{p_{s-1}+1} \cdots g_{p_{s}-1}\right)\left(g_{p_{s}+1} \cdots g_{k}\right) \\
& \vdots \\
& =\left.\left(g_{1} \cdots g_{p_{1}-1}\right)\right|_{X_{r}}\left(g_{p_{1}+1} \cdots g_{p_{2}-1}\right) \cdots\left(g_{p_{s}+1} \cdots g_{k}\right) \\
& =\left.\left(\left(g_{1} \cdots g_{p_{1}-1}\right)\left(g_{p_{1}+1} \cdots g_{p_{2}-1}\right) \cdots\left(g_{p_{s}+1} \cdots g_{k}\right)\right)\right|_{X_{r}} \\
& =\left.\left(g_{q_{1}} \cdots g_{q_{l}}\right)\right|_{X_{r}} .
\end{aligned}
$$

But also $\left.e_{i j ; f}\right|_{X \backslash X_{r}}=\operatorname{id}_{X \backslash X_{r}}=\left.\left(g_{q_{1}} \cdots g_{q_{l}}\right)\right|_{X \backslash X_{r}}$, so it follows that $e_{i j ; f}=g_{q_{1}} \cdots g_{q_{l}} \in\left\langle U_{r}\right\rangle$, completing the proof.

Corollary 3.14. If $\mu_{1}=2$, then $\operatorname{idrank}(S) \geq \rho+1$, where $\rho$ is defined in Corollary 3.9.
Proof. Let $G$ be an arbitrary idempotent generating set for $S$. By Lemma 3.13, $G$ contains a generating set $U_{i}$ for $S_{i} \cong \mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)$ for each $i \in[n]$, and we have $\left|U_{i}\right| \geq$ $\operatorname{rank}\left(\mathcal{E}\left(X_{i}, \mathcal{P}_{i}\right)\right)=\rho_{\mu_{i}, i}$. By Theorem 2.3, $\rho_{\mu_{i}, i}=\mu_{i} \rho_{i}+i!\binom{\mu_{i}}{2}$, unless $i=1$, in which case $\rho_{\mu_{i}, i}=\rho_{21}=2=1+\left(\mu_{1} \rho_{1}+1!\binom{\mu_{1}}{2}\right)$. Therefore, $G$ contains at least

$$
\sum_{i=1}^{n} \rho_{\mu_{i}, i}=1+\sum_{i=1}^{n}\left(\mu_{i} \rho_{i}+i!\binom{\mu_{i}}{2}\right)
$$

elements from these generating sets of $S_{1}, \ldots, S_{n}$. By the last two paragraphs of the proof of Corollary 3.9, $G$ contains a further

$$
\sum_{i=1}^{n} \mu_{i} v_{i}+\sum_{1 \leq i<j \leq n} \mu_{i} \mu_{j} \frac{j!}{(j-i)!}
$$

elements. Adding the two expressions above, we see that $|G| \geq \rho+1$, and the proof is complete.

For the proof of the next result, we use the standard notation $f=\left(\begin{array}{ccc}A_{1} & \ldots & A_{k} \\ a_{1} & \ldots & a_{k}\end{array}\right)$ to indicate that $f$ is the function with domain $A_{1} \cup \cdots \cup A_{k}$ that maps each of the points in $A_{q}$ to $a_{q}$ for each $q \in[k]$.

Proposition 3.15. For each $q \in[n]$, let $U_{q}$ be an idempotent generating set for $S_{q}$. For each $i \in[m]$, choose sets $J_{i} \subseteq[m]$ such that $\left|J_{i}\right|=v_{n_{i}}$ and $\left\{n_{j}: j \in J_{i}\right\}=\left\{n_{q}\right.$ : $\left.q \in[m], n_{q}<n_{i}\right\}$. For each $i \in[m]$ and $j \in J_{i}$, choose some $f_{i j} \in \operatorname{Surj}\left(n_{i}, n_{j}\right)$. Then $U=U_{1} \cup \cdots \cup U_{n} \cup W_{1} \cup W_{2}$ is a generating set for $S$, where

$$
\begin{aligned}
& W_{1}=\left\{e_{i j ; f}: 1 \leq i<j \leq m, n_{i}>n_{j}, f \in \operatorname{Inj}\left(n_{j}, n_{i}\right)\right\} \quad \text { and } \\
& W_{2}=\left\{e_{j i ; f_{i j}}: i \in[m], j \in J_{i}\right\} .
\end{aligned}
$$

Proof. By Proposition 3.3, it suffices to prove that $G_{1} \cup G_{2} \subseteq\langle U\rangle$. Since $S_{q}=\left\langle U_{q}\right\rangle$ for each $q \in[n]$, it follows that $\langle U\rangle$ contains:
(i) each $e_{i j}^{(k)}$ with $k \in[m], i, j \in\left[n_{k}\right]$ and $i \neq j$; and
(ii) each $e_{i j ; f}$ with $i, j \in[m], i \neq j, n_{i}=n_{j}$ and $f \in \mathcal{S}_{n_{i}}$.

Since $W_{1} \subseteq U$, it remains to show that $\langle U\rangle$ contains:
(iii) each $e_{j i, f}$ with $i, j \in[m], n_{i}>n_{j}$ and $f \in \operatorname{Surj}\left(n_{i}, n_{j}\right)$.

Let $i, j, f$ be as in (iii). Let $k \in J_{i}$ be such that $n_{k}=n_{j}$ and, for simplicity, put $g=f_{i k}$, so $e_{k i ; g} \in U$. Write $f=\left(\begin{array}{ccc}A_{1} & \cdots & A_{n_{j}} \\ 1 & \cdots & n_{j}\end{array}\right)$ and $g=\left(\begin{array}{ccc}B_{1} & \cdots & B_{n_{j}} \\ 1 & \cdots & n_{j}\end{array}\right)$. Also, choose $b_{1}, \ldots, b_{n_{j}}$ such that $b_{q} \in B_{q}$ for each $q$. Put $h=\left(\begin{array}{ccc}A_{1} & \cdots & A_{n_{j}} \\ b_{1} & \cdots & b_{n_{j}}\end{array}\right) \in \mathcal{T}_{n_{i}}$. Since $n_{j}<n_{i}$, note that $h \in \mathcal{E}_{n_{i}}$ and so $h^{(i)} \in \mathcal{E}_{n_{i}}^{(i)} \subseteq\langle U\rangle$. It is clear that $e_{k i, f}=h^{(i)} e_{k i ; g} \in\langle U\rangle$. In particular, if $k=j$, then we have shown that $e_{j i ; f}=e_{k i, f} \in\langle U\rangle$. So suppose that $k \neq j$. Now choose $a_{1}, \ldots, a_{n_{j}}$, so $a_{q} \in A_{q}$ for each $q$. Put $d=\left(\begin{array}{ccc}1 & \cdots & n_{j} \\ a_{1} & \ldots & a_{n j}\end{array}\right) \in \operatorname{Inj}\left(n_{j}, n_{i}\right)$. Note that $e_{i j ; d} \in W_{1} \subseteq U$ and that $e_{j k ; 1} \in\langle U\rangle$ as shown above, since $n_{j}=n_{k}$. It is clear that $d f=1 \in \mathcal{S}_{n_{j}}$ and one may then easily check that $e_{j i ; f}=\left(e_{i j ; d} e_{j k ; 1} e_{k i ; f}\right)^{2} \in\langle U\rangle$, completing the proof.

We are now ready to prove the two main results of the paper. Again, these are stated in terms of the parameters $\mu_{i}, v_{i}, \rho_{i}$ introduced at the beginning of this section and in Theorem 2.1.

Theorem 3.16. We have $\operatorname{rank}(S)=\operatorname{idrank}(S)=\rho$, where

$$
\rho=\sum_{i=1}^{n}\left(\mu_{i} \rho_{i}+i!\binom{\mu_{i}}{2}+\mu_{i} v_{i}\right)+\sum_{1 \leq i<j \leq n} \mu_{i} \mu_{j} \frac{j!}{(j-i)!},
$$

unless $\mu_{1}=2$, in which case $\operatorname{rank}(S)=\rho$ and $\operatorname{idrank}(S)=\rho+1$.
Proof. Let $U=U_{1} \cup \cdots \cup U_{n} \cup W_{1} \cup W_{2}$ be an idempotent generating set as described in Proposition 3.15, with $U_{1}, \ldots, U_{n}$ of minimal size. As in the proof of Corollary 3.9,

$$
\left|W_{1}\right|=\sum_{1 \leq i<j \leq n} \mu_{i} \mu_{j} \frac{j!}{(j-i)!} \quad \text { and } \quad\left|W_{2}\right|=\sum_{r=1}^{m} v_{n_{r}}=\sum_{i=1}^{n} \mu_{i} v_{i} .
$$

As in the proof of Corollary 3.14,

$$
\left|U_{1}\right|+\cdots+\left|U_{n}\right|=\sum_{i=1}^{n}\left(\mu_{i} \rho_{i}+i!\binom{\mu_{i}}{2}\right),
$$

unless $\mu_{1}=2$, in which case we must add 1 to the right-hand side of this last expression. Adding these values, we conclude that

$$
|U|= \begin{cases}\rho & \text { if } \mu_{1} \neq 2 \\ \rho+1 & \text { if } \mu_{1}=2\end{cases}
$$

Combined with Corollaries 3.9 and 3.14, and noting that $U \subseteq E$, this shows that $\operatorname{rank}(S)=\operatorname{idrank}(S)=\rho$ if $\mu_{1} \neq 2$, and also that $\operatorname{idrank}(S)=\rho+1$ if $\mu_{1}=2$. To complete the proof, it suffices to prove that $S=\langle V\rangle$ for some $V \subseteq S$ with $|S|=\rho$ if $\mu_{1}=2$. For the remainder of the proof, we assume that $\mu_{1}=2$.

We have already seen that $S=\langle U\rangle$ and $|U|=\rho+1$. Also, since there is a unique generating set of size 2 for $S_{1} \cong \mathcal{E}\left(X_{1}, \mathcal{P}_{1}\right) \cong \mathcal{E}_{2}$, namely $U_{1}=\{f, g\}$, where $f=e_{m-1, m ; 1}$ and $g=e_{m, m-1 ; 1}$, we see that $U$ must contain both $f$ and $g$. Let $h \in \operatorname{Inj}\left(1, n_{1}\right)=$ $\operatorname{Inj}\left(n_{m}, n_{1}\right)$ be arbitrary, and put $e=e_{1 m ; h}$, so that $e \in W_{1} \subseteq U$. It is easy to check that $e=(e g) f$ and $g=f(e g)$. It follows that $\langle e, f, g\rangle=\langle e g, f\rangle$ and so $S=\langle V\rangle$, where $V=(U \backslash\{e, g\}) \cup\{e g\}$. Since $|V|=\rho$, this completes the proof.

For the statement of the next result, by 'minimal idempotent generating set' we mean an idempotent generating set that has the smallest possible size.

## Theorem 3.17.

(i) Every idempotent generating set of $S$ contains a minimal idempotent generating set.
(ii) Every minimal idempotent generating set of $S$ is of the form described in Proposition 3.15 and with each $U_{q}$ of minimal size.
(iii) The number of minimal idempotent generating sets of $S$ is equal to

$$
\prod_{i=1}^{n} \sigma_{\mu_{i}, i} \times \prod_{\substack{1 \leq i<j \leq n \\ \mu_{i} \neq 0 \neq \mu_{j}}} \mu_{i} \mu_{j} S(j, i) i!
$$

where $S(j, i)$ is a Stirling number (of the second kind) and the numbers $\sigma_{\mu_{i}, i}$ are defined in Theorem 2.4.

Proof. Let $U$ be an arbitrary idempotent generating set for $S$. By Lemma 3.13, $U$ contains an idempotent generating set $U_{r}$ of $S_{r}$ for each $r \in[n]$. By Theorem 2.4, each $U_{r}$ contains an idempotent generating set $V_{r}$ of minimal size. As in the proof of Corollary 3.9, $U$ must contain the sets

$$
\begin{aligned}
& W_{1}=\left\{e_{i j, f}: 1 \leq i<j \leq m, n_{i}>n_{j}, f \in \operatorname{Inj}\left(n_{j}, n_{i}\right)\right\} \quad \text { and } \\
& W_{2}=\left\{e_{j i, f_{i j}}: i \in[m], j \in J_{i}\right\}
\end{aligned}
$$

for some choice of sets $J_{i}$ and functions $f_{i j} \in \operatorname{Surj}\left(n_{i}, n_{j}\right)$. The set $V_{1} \cup \cdots \cup V_{n} \cup W_{1} \cup$ $W_{2} \subseteq U$ has size $\operatorname{idrank}(S)$, as stated in Theorem 3.16, and is a generating set for $S$ by Proposition 3.15. This completes the proof of (i).

If $U$ is an arbitrary idempotent generating set of minimal possible size, then we must in fact have $U=V_{1} \cup \cdots \cup V_{n} \cup W_{1} \cup W_{2}$ (in the above notation), proving (ii). For each $i \in[n]$, we may choose $V_{i}$ in $\sigma_{\mu_{i} i}$ ways. To specify $W_{2}$, for each $k \in M_{j}$ where $j \in[n]$ is such that $\mu_{j} \neq 0$, and for each $i \in[n]$ with $i<j$ and $\mu_{i} \neq 0$, we must choose some $e_{k l ; f}$ where $l \in M_{i}$ and $f \in \operatorname{Surj}(j, i)$. There are $\mu_{j}$ such $k, \mu_{i}$ such $l$ and $|\operatorname{Surj}(j, i)|=S(j, i) i!$ such $f$. Multiplying these values as appropriate gives (iii).
